Point A

To send 224bits data by 8bit chunks , ##SCKI should input less than "A x 8times" at least.
If it takes greater than A x 8, it works internal latch automatically.

Point B

To send next 224bits, "**#1**"should input greater than "A x 8times" + "A x 8 times(or 1.34us) from #224 SCKI at least.
If it takes less than A x 8, it can't work internal latch and IC recognize next SCKI as #225.
