These are VID interface waveform of the EVM GUI software.

In LM10011 VID interface timing characteristic of datasheet P5,  $t_1$  and  $t_3$  is max 1 $\mu$ s.

I think we have to wait more than 1 $\mu$ s between VID signal change and VIDS signal change.

However there is no wait time on VID interface waveform of EVM GUI.

What can I think about this?

Is the timing of EVM GUI wrong? Could you tell me your opinion?
