<Question of LED's behavior in case of Extender mode>

There are LED_A(Linkup, ACT, Speed) and LED_B(Linkup, ACT, Speed).

In case of Extender mode, could you let us know each behavior of LEDs?

LED_A : Does these LEDs indicate the condition(link-up, act and speed)between Main Board and External Board?

LED_B : Does these LEDs indicate the condition(link-up, act and speed)between External Board and other board?

What we would like to confirm is that each LEDs correspond to the condition of each connections or not.
