

DP83TD510E : Throughput Check

Test Setup

- While doing this test do not send any data from MAC side on any of the DUTs

Test Procedure

- Setup the boards (A and B) and connect them through the desired cable length
- Enable reverse loop-back on board B.
- Enable packet generation and checker on another connected board (board A).
- Following parameters were monitored :
 - Link-status
 - Number of packets received
 - Number of packets received with errors.

Test Results

USB-2-MDIO

File Settings Help

PHY ID: 00 Extended Register: Yes Port Status: **HW Connected**

Register Address: Data: Open Port Close Port

Read Write ClearText

```
packet_checker.txt file is open...
Register 0010 is: 0001
Register 011F is: 0001
Register 011F is: 0B00
Register 011D is: 7CC7
Register 011E is: 0001
Register 0121 is: 0000
Register 0122 is: 0000
End of file.
```

→ Link is up

→ ~1million packets

→ 0 packets with errors

- Similar number of packets were sent multiple times and 0 packet errors were observed.

Test Scripts

Load on Board B

Reverse Loopback Enable

```
1 begin
2 0016 0110 //enable reverse loopback to send the data back on cable
3 end
```

Load on Board A

Packet Gen Enable

Reg addresses

Values to be written

```
1 begin
2 001F 8000 //reset the part
3 0119 155F //enable packet generation towards cable and packet checker coming back from the cable
4 001F 4000 //soft reset
5 end
```

Packet Checker

Registers being read

```
1 begin
2 0010 //x0010 should read 0x0001 for successful link-up
3 011F 0001 //latches the packets received and error status
4 011F //should read x0B00 for PRBS lock
5 011D //
6 011E //number of packets received is 32bits number with lower 16bits as value of 011D and higher 16bits as value of 011E
7 0121 //
8 0122 //number of errors received is 32bits number with lower 16bits as value of 0121 and higher 16bits as value of 0122
9 end
```
