

# CMRR for discrete INA and PGA855

# Differential gain of 5V/V

$$V_{in\_dif} \times G = V_{out\_dif}$$
$$100\text{mV} \times 5 = 500\text{mV}$$

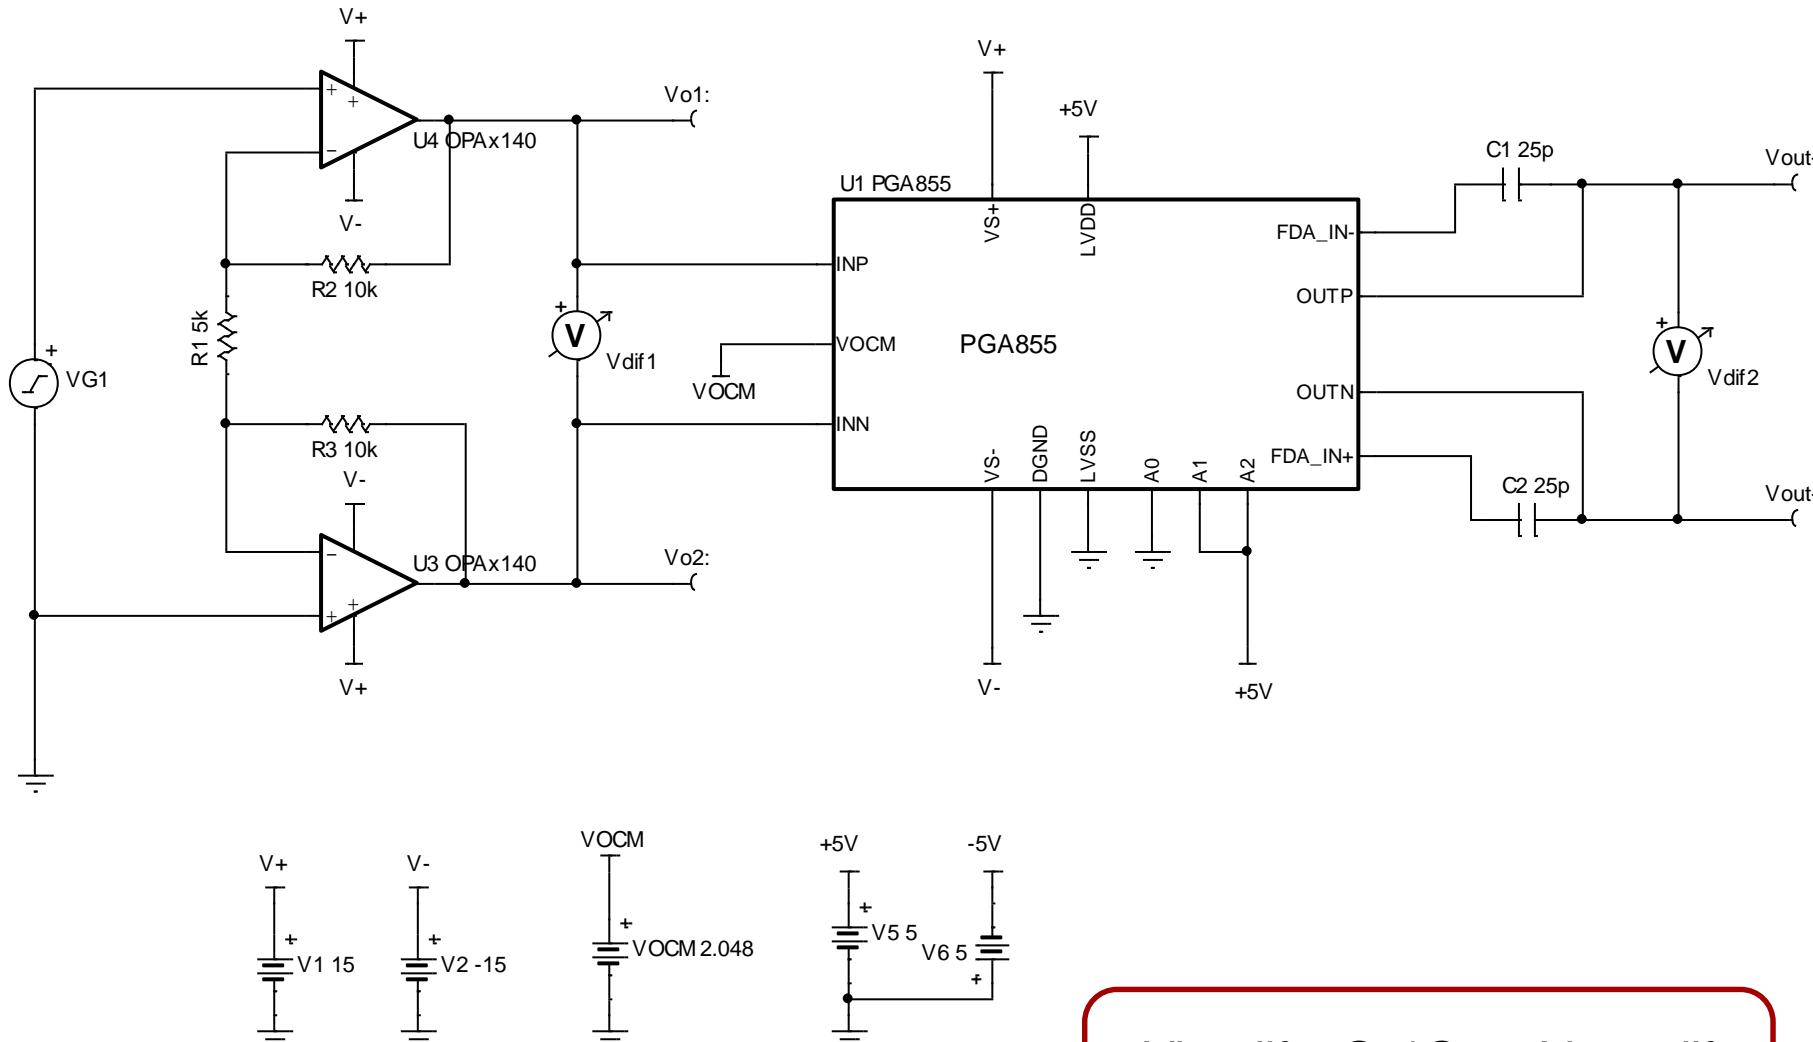

# Common mode gain of 1V/V

$$V_{cm} \times G_{cm} = V_{out\_cm} = (100\text{mV} \times 1\text{V/V}) \approx 100\text{mV} (99.88\text{mV})$$

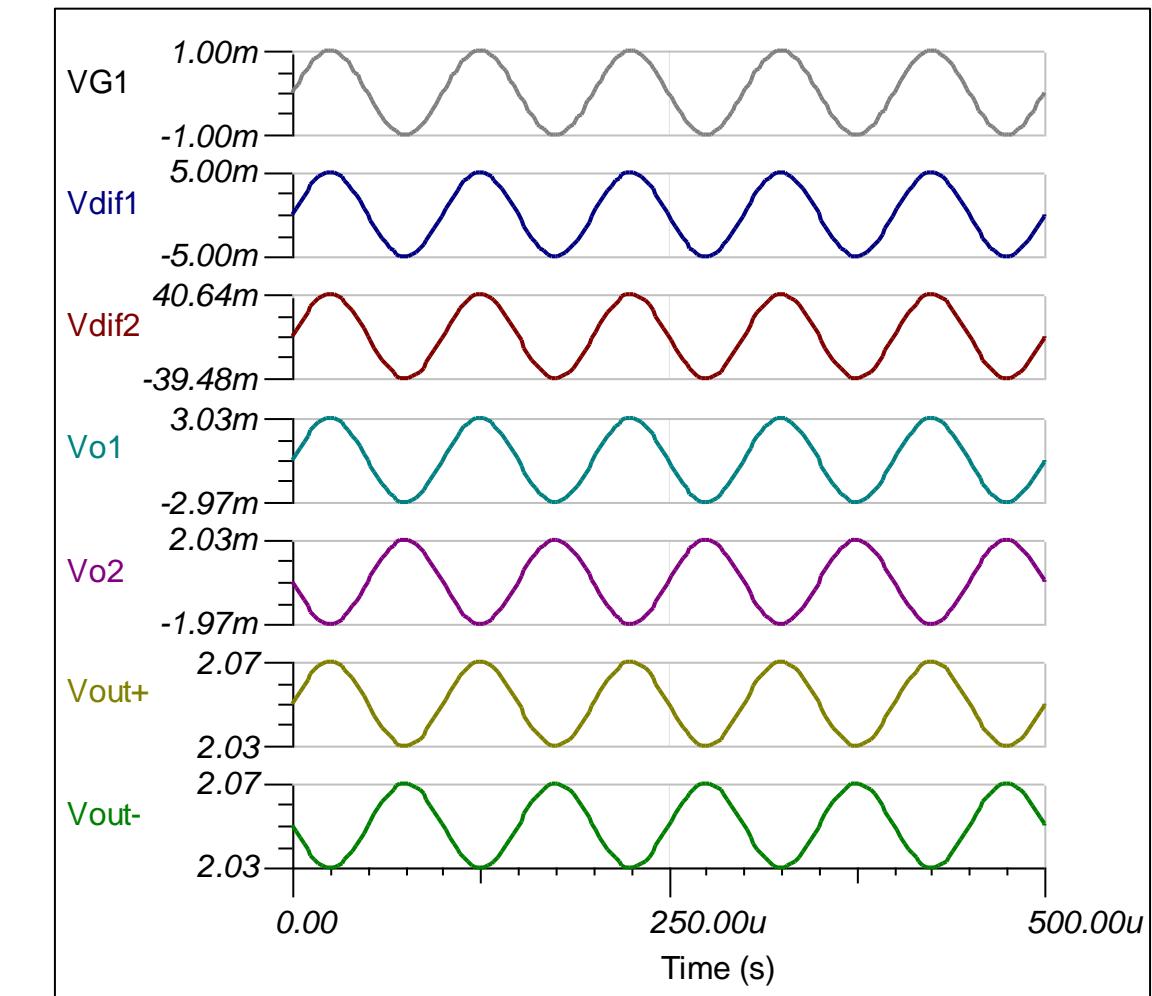

$$V_{out\_dif} \approx 0$$

# Discrete INA + PGA855 (Differential response)

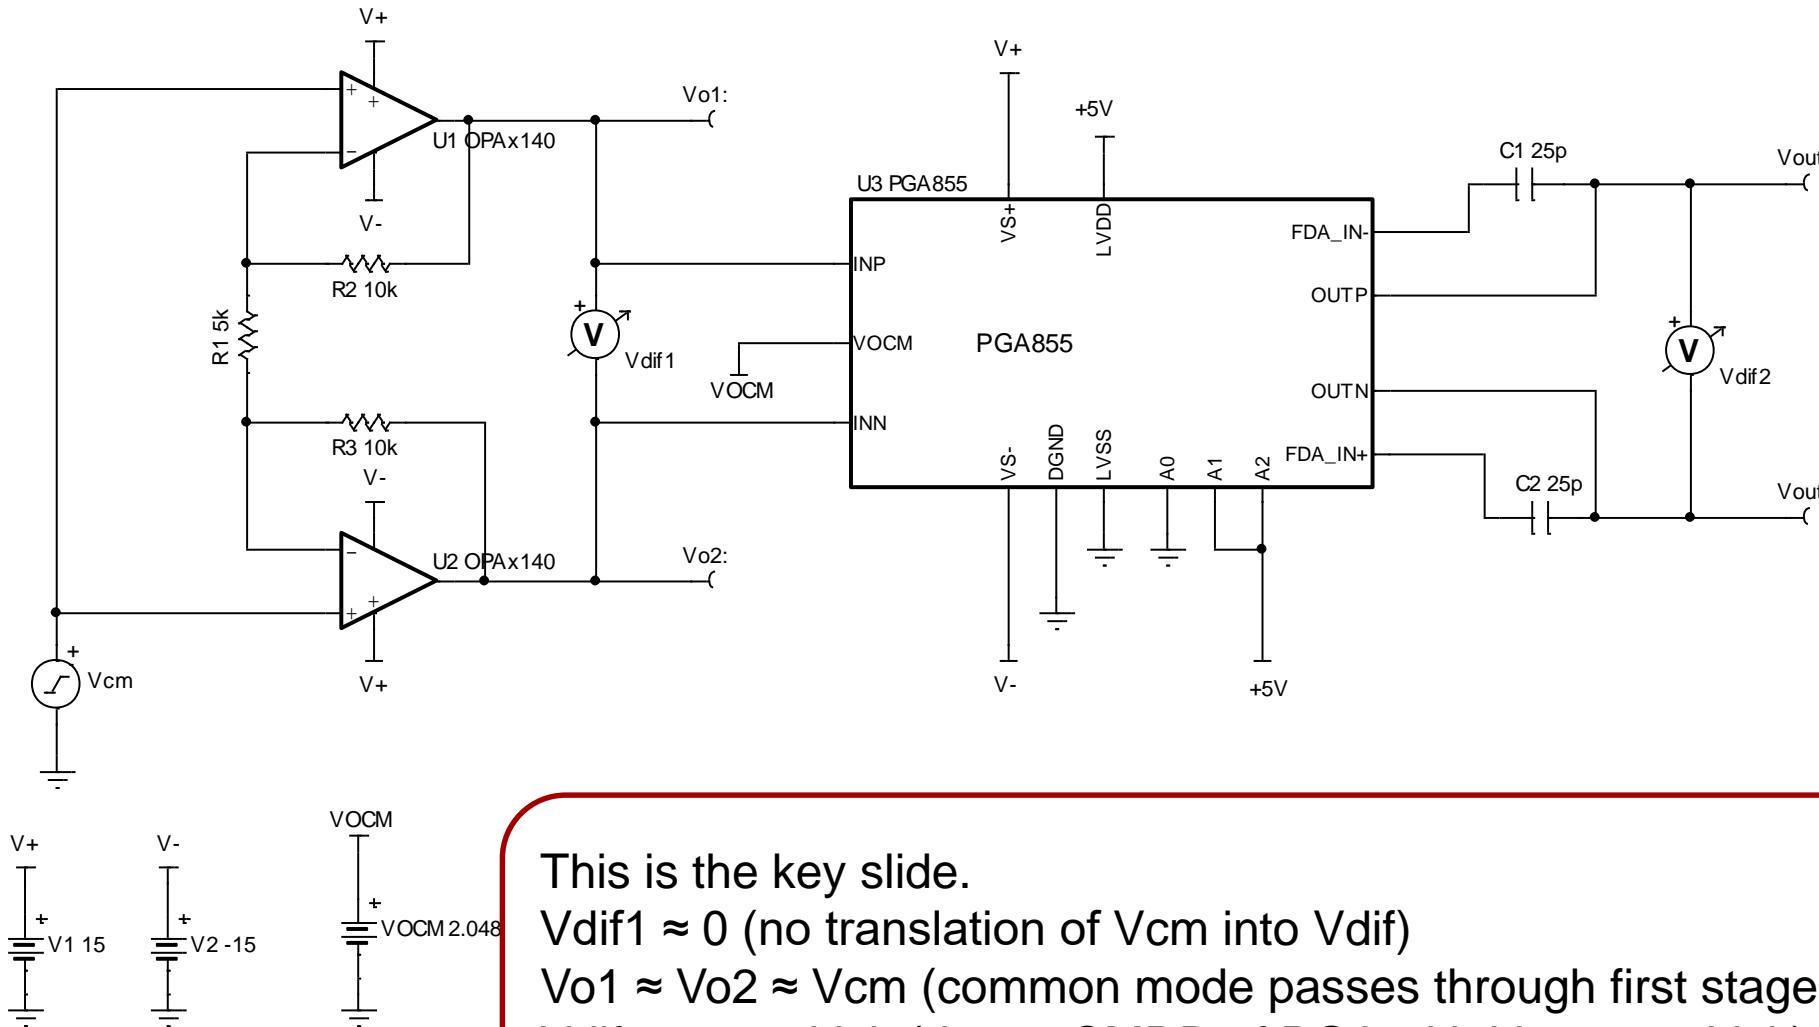

$$\text{Vin\_dif} \times G1 \times G1 = \text{Vout\_dif}$$

$$(1\text{mV}) \times (5\text{V/V}) \times (8) \approx 40\text{mV}$$

# Discrete INA + PGA855 (common mode response)

This is the key slide.  
 $V_{dif1} \approx 0$  (no translation of  $V_{cm}$  into  $V_{dif}$ )  
 $V_{o1} \approx V_{o2} \approx V_{cm}$  (common mode passes through first stage)  
 $V_{dif2} = 561\mu V_{pk}$  (due to CMRR of PGA with  $V_{cm} = 1mV_{pk}$ )
