

LTC6090

High Voltage CMOS Amplifier

DESCRIPTION

Demonstration circuit 1979A is a high voltage CMOS amplifier featuring the LTC[®]6090. An onboard isolated flyback converter provides $\pm 62\text{V}$ power to the LTC6090 for evaluating large signal performance. A jumper sets the gain of the ultrahigh-input impedance circuit to either unity ($1\times$) or $20\times$. In the $20\times$ mode, a signal input of just 3V can provide nearly full-swing output. In the unity-gain setting, the part operates as a precision buffer for high voltage signals.

SPECIAL FORM-FACTOR

The DC1979A includes a preassembled power converter and amplifier circuit on a small printed circuit, so the user only needs to furnish a 7V to 12V power source to operate the demo. The layout has provisions for optional BNC connectors and mounting features to install the board in a standard plastic enclosure if a permanent utility unit is desired. Refer to the Appendix for mechanical details.

Design files for this circuit board are available at <http://www.linear.com/demo>

PERFORMANCE SUMMARY

Specifications are at $T_A = 25^\circ\text{C}$

SYMBOL	PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
V_{IN}	Input Signal, Maximum Usable	Gain = $20\times$, Onset of Output Clipping Gain = $1\times$, V_{CM} Limited		± 3.1 ± 60		V V
I_{IN}	V_{IN} Leakage Current	V_{IN} = Within Usable Range		3		pA
V_{OUT}	Output Voltage Range	Gain = $20\times$, Onset of Output Clipping		± 62		V
V_{SUPPLY}	Input to Supply Converter		7	9	12	V
I_{SUPPLY}	Quiescent Supply Current	$V_{IN} = 9\text{V}$, No Loading of Op Amp Output		62		mA
UVLO	Undervoltage Lockout			6.5		V

OPERATING PRINCIPLES

The LTC6090 op amp is set up in the standard noninverting voltage-gain configuration. GAIN jumper JP2 provides a means of controlling the gain by adding or deleting a gain resistor in the feedback path by choosing the $1\times$ or $20\times$ setting.

A small LT[®]8300 flyback converter is used to provide about $\pm 65\text{V}$ from a convenient low voltage supply in the 7V to 12V range. A blue LED is in series with the minus supply to the LTC6090, so the op amp actually sees a resultant supply of about 65V/–62V. The LED provides a pleasant

level of illumination at the 2.6mA quiescent current of the op amp.

To minimize signal loading, no input load resistor is included. The op amp can be connected to the instrumentation with a coaxial cable at J2, since a 50 Ω output termination is included. No far-end termination should be used, as the op amp cannot deliver large signals across a 100 Ω DC load. In the event of an output overload, the LTC6090, having built-in thermal shutdown, will automatically go into a low power state to protect itself from damage. After

APPENDIX

One especially useful purpose for the DC1979A is to provide precision measurements in higher voltage circuits. The usual $10\text{M}\Omega$ presented by most instruments will often unacceptably load such circuits and give highly erroneous results. For providing a wide-range signal buffer, the GAIN jumper is set to $1\times$ so that the only errors are from the V_{OS} and input leakage current of the LTC6090. With a $\pm 50\text{V}$ reading on a $4\frac{1}{2}$ digit DMM (i.e., 200V scale), this error is generally less than one count of the display (10mV), even for a several-G Ω source resistance signal. If one desires to use the DC1979A as a permanent high voltage buffer unit, then the following information will be helpful.

Figure 2. Base Hole and PCB Location

THE CONSTRUCTION

The following sketches show the hole placement for the BNC connectors and an optional toggle switch. The toggle switch is for use with a 9V battery that can fit inside the case, or other provisions could be made to provide power connections to the board as desired (for example, a banana jack, wall-wart DC jack, etc.).

Figure 2 provides the hole placement for the OUT signal (on J2). This is to pass the output signal through the bottom of the case using a back-mounted Connex 112404 vertical BNC connector. Two 4-40-1/4" screws are needed to mount the PCB to the case.

Figure 3 shows the hole placement for the end panel. It includes the IN signal on J1 using a Molex SD-73100-0105 right-angle BNC connector on the top side of the board, and the smaller hole is for the miniature toggle switch, such as from the manufacturer, C&K.

Figure 3. End Panel Hole Locations

APPENDIX

Figure 4 is an interior photo of the finished unit including the switch and 9V battery. The translucent blue Hammond 1593KTBU was selected so the LED would be visible during

operation. Standard adapters can be used to transform the output into a banana-plug pair that can directly attach the unit to a DMM, as shown in Figure 5.

DEMO MANUAL DC1979A

DEMONSTRATION BOARD IMPORTANT NOTICE

Linear Technology Corporation (LTC) provides the enclosed product(s) under the following **AS IS** conditions:

This demonstration board (DEMO BOARD) kit being sold or provided by Linear Technology is intended for use for **ENGINEERING DEVELOPMENT OR EVALUATION PURPOSES ONLY** and is not provided by LTC for commercial use. As such, the DEMO BOARD herein may not be complete in terms of required design-, marketing-, and/or manufacturing-related protective considerations, including but not limited to product safety measures typically found in finished commercial goods. As a prototype, this product does not fall within the scope of the European Union directive on electromagnetic compatibility and therefore may or may not meet the technical requirements of the directive, or other regulations.

If this evaluation kit does not meet the specifications recited in the DEMO BOARD manual the kit may be returned within 30 days from the date of delivery for a full refund. THE FOREGOING WARRANTY IS THE EXCLUSIVE WARRANTY MADE BY THE SELLER TO BUYER AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE. EXCEPT TO THE EXTENT OF THIS INDEMNITY, NEITHER PARTY SHALL BE LIABLE TO THE OTHER FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES.

The user assumes all responsibility and liability for proper and safe handling of the goods. Further, the user releases LTC from all claims arising from the handling or use of the goods. Due to the open construction of the product, it is the user's responsibility to take any and all appropriate precautions with regard to electrostatic discharge. Also be aware that the products herein may not be regulatory compliant or agency certified (FCC, UL, CE, etc.).

No License is granted under any patent right or other intellectual property whatsoever. **LTC assumes no liability for applications assistance, customer product design, software performance, or infringement of patents or any other intellectual property rights of any kind.**

LTC currently services a variety of customers for products around the world, and therefore this transaction **is not exclusive**.

Please read the DEMO BOARD manual prior to handling the product. Persons handling this product must have electronics training and observe good laboratory practice standards. **Common sense is encouraged.**

This notice contains important safety information about temperatures and voltages. For further safety concerns, please contact a LTC application engineer.
