

# MSP430F665x, MSP430F645x, MSP430F565x, MSP430F535x Mixed-Signal Microcontrollers

## 1 Features

- Low supply voltage range:  
3.6 V down to 1.8 V
- Ultra-low power consumption
  - Active mode (AM):  
All system clocks active:  
295  $\mu$ A/MHz at 8 MHz, 3.0 V, flash program execution (typical)
  - Standby mode (LPM3):  
Watchdog with crystal, and supply supervisor operational, full RAM retention, fast wakeup:  
2.0  $\mu$ A at 2.2 V, 2.2  $\mu$ A at 3.0 V (typical)
  - Shutdown, real-time clock (RTC) mode (LPM3.5):  
Shutdown mode, active RTC with crystal:  
1.1  $\mu$ A at 3.0 V (typical)
  - Shutdown mode (LPM4.5):  
0.45  $\mu$ A at 3.0 V (typical)
- Wake up from standby mode in 3  $\mu$ s (typical)
- 16-bit RISC architecture, extended memory, up to 20-MHz system clock
- Flexible power-management system
  - Fully integrated LDO with programmable regulated core supply voltage
  - Supply voltage supervision, monitoring, and brownout
- Unified clock system
  - FLL control loop for frequency stabilization
  - Low-power low-frequency internal clock source (VLO)
  - Low-frequency trimmed internal reference source (REFO)
  - 32-kHz crystals (XT1)
  - High-frequency crystals up to 32 MHz (XT2)
- Four 16-bit timers with 3, 5, or 7 capture/compare registers
- Three universal serial communication interfaces (USCIs)
  - USC1\_A0, USC1\_A1, and USC1\_A2 each support:
    - Enhanced UART with automatic baud-rate detection
    - IrDA encoder and decoder
    - Synchronous SPI
  - USC1\_B0, USC1\_B1, and USC1\_B2 each support:
    - I<sup>2</sup>C
    - Synchronous SPI
- Full-speed universal serial bus (USB)
  - Integrated USB-PHY
  - Integrated 3.3-V and 1.8-V USB power system
  - Integrated USB-PLL
  - Eight input and eight output endpoints
- 12-bit analog-to-digital converter (ADC) with internal shared reference, sample-and-hold, and autoscan feature
- Two 12-bit digital-to-analog converters (DACs) with synchronization
- Voltage comparator
- Integrated LCD driver with contrast control for up to 160 segments
- Hardware multiplier supports 32-bit operations
- Serial onboard programming, no external programming voltage needed
- 6-channel internal DMA
- RTC module with supply voltage backup switch
- [Device Comparison](#) summarizes the available family members

## 2 Applications

- Analog and digital sensor systems
- Digital motor controls
- Remote controls
- Thermostats
- Digital timers
- Hand-held meters

## 3 Description

The TI MSP family of ultra-low-power microcontrollers consists of several devices that feature different sets of peripherals targeted for various applications. The architecture, combined with five low-power modes, is optimized to achieve extended battery life in portable measurement applications. The device features a powerful 16-bit RISC CPU, 16-bit registers, and constant generators that contribute to maximum code efficiency. The digitally controlled oscillator (DCO) allows the device to wake up from low-power modes to active mode in 3  $\mu$ s (typical).

The MSP430F665x and MSP430F565x series are microcontroller configurations with four 16-bit timers, a high-performance 12-bit ADC, three USCIs, a hardware multiplier, DMA, an RTC module with alarm capabilities, a comparator, USB 2.0, and up to 74 I/O pins.

The MSP430F645x and MSP430F535x series are microcontroller configurations with an integrated 3.3-V LDO, four 16-bit timers, a high-performance 12-bit ADC, three USCIs, a hardware multiplier, DMA, an RTC module with alarm capabilities, a comparator, and up to 74 I/O pins.

For complete module descriptions, see the [MSP430F5xx and MSP430F6xx Family User's Guide](#).

#### Device Information

PART NUMBER <sup>(1)</sup>	PACKAGE	BODY SIZE <sup>(2)</sup>
MSP430F6659IPZ	LQFP (100)	14 mm × 14 mm
MSP430F6659IZCA	nFBGA (113)	7 mm × 7 mm
MSP430F6659IZQW <sup>(3)</sup>	MicroStar Junior™ BGA (113)	7 mm × 7 mm

- (1) For the most current device, package, and ordering information, see the *Package Option Addendum* in [Section 11](#), or see the TI website at [www.ti.com](http://www.ti.com).
- (2) The sizes shown here are approximations. For the package dimensions with tolerances, see the *Mechanical Data* in [Section 11](#).
- (3) All orderable part numbers in the ZQW (MicroStar Junior BGA) package have been changed to a status of Last Time Buy. Visit the [Product life cycle](#) page for details on this status.

## 5 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changed from revision D to revision E

Changes from September 27, 2018 to September 11, 2020	Page
• Updated the numbering for sections, tables, figures, and cross-references throughout the document.....	1
• Added nFBGA package (ZCA) information throughout document.....	1
• Added note about status change for all orderable part numbers in the ZQW package in <a href="#">Device Information</a> ..	1
• Removed package options that are no longer available (MSP430F6658 and MSP430F6458 in the ZQW package) in <a href="#">Table 6-1, Device Comparison</a> .....	9
• Removed package options that are no longer available (MSP430F6658IZQW and MSP430F6458IZQW) from the caption of <a href="#">Figure 7-5, 113-Pin ZQW Package (Top View) – MSP430F6659IZQW, MSP430F6459IZQW, MSP430F5659IZQW, MSP430F5658IZQW, MSP430F5359IZQW, MSP430F5358IZQW</a> .....	11
• Changed the MAX value of the $I_{ERASE}$ and $I_{MERASE}$ , $I_{BANK}$ parameters in <a href="#">Section 8.57, Flash Memory</a> .....	60
• Corrected the connection of the P7SEL.x signal in <a href="#">Figure 9-11, Port P7 (P7.4 to P7.7) Diagram</a> .....	110

Changes from revision C to revision D

Changes from October 22, 2013 to September 26, 2018	Page
• Format and organization changes throughout document, including addition of section numbering.....	1
• Added <i>Device Information</i> table.....	1
• Added <a href="#">Section 4</a> and moved all functional block diagrams to it.....	3
• Added <a href="#">Section 6.1, Related Products</a> .....	10
• Added "Port U is supplied the LDOO rail" to the description of PU.0 and PU.1 in <a href="#">Section 7.2, Signal Descriptions</a> .....	16
• Added <a href="#">Section 8</a> and moved all electrical specifications to it.....	24
• Added typical conditions statements at the beginning of <a href="#">Section 8, Specifications</a> .....	24
• Added <a href="#">Section 8.2, ESD Ratings</a> .....	24
• Moved <a href="#">Section 8.7, Thermal Resistance Characteristics</a> .....	28
• Changed the TYP value of the $C_{L,eff}$ parameter with Test Conditions of "XTS = 0, XCAPx = 0" from 2 pF to 1 pF in <a href="#">Section 8.16, Crystal Oscillator, XT1, Low-Frequency Mode</a> .....	33
• Changed the MIN value of the $V_{(DVCC\_BOR\_hys)}$ parameter from 60 mV to 50 mV in <a href="#">Section 8.21, PMM, Brownout Reset (BOR)</a> .....	37
• Updated notes (1) and (2) and added note (3) in <a href="#">Section 8.27, Wake-up Times From Low-Power Modes and Reset</a> .....	39
• Corrected typo in the description of the $V_{BAT3}$ parameter: changed " $V_{BAT3} \neq V_{BAT}/3$ " to " $V_{BAT3} \approx V_{BAT}/3$ " in <a href="#">Section 8.30, Battery Backup</a> .....	40
• Removed ADC12DIV from the formula for the TYP value in the second row of the $t_{CONVERT}$ parameter in <a href="#">Section 8.38, 12-Bit ADC, Timing Parameters</a> , because ADC12CLK is after division.....	48
• Added the $TC_{SENSOR}$ parameter in <a href="#">Section 8.42, 12-Bit ADC, Temperature Sensor and Built-In <math>V_{MID}</math></a> .....	49
• Changed the note that starts "The temperature sensor offset ..." from "...offset can be as much as $\pm 20^{\circ}C$ " to "...offset can be significant".....	49
• Changed DAC12xDAT to DAC12_xDAT in $I_{L(DAC12)}$ Test Conditions in <a href="#">Section 8.47, 12-Bit DAC, Output Specifications</a> .....	54
• Removed note from " $Ri_{(V_{REF+})}$ , $Ri_{(V_{eREF+})}$ " parameter in <a href="#">Section 8.48, 12-Bit DAC, Reference Input Specifications</a> .....	55
• Changed from $f_{DAC12\_0OUT}$ to $f_{DAC12\_1OUT}$ in the first row of the Test Conditions for the "Channel-to-channel crosstalk" parameter in <a href="#">Section 8.50, 12-Bit DAC, Dynamic Specifications (Continued)</a> .....	56

- Changed the value of DAC12\_xDAT from 7F7h to F7Fh and changed the x-axis label from  $f_{Toggle}$  to  $1/f_{Toggle}$  in [Figure 8-22, Crosstalk Test Conditions](#) ..... 56
- [Section 8.51, Comparator\\_B](#): Added second row for the  $t_{EN\_CMP}$  parameter with Test Conditions of "CBPWRMD = 10" and MAX value of 100  $\mu$ s; Removed "CBPWRMD = 10" option in first row of Test Conditions..... 57
- Added note on  $R_{PUR}$  in [Section 8.55, USB-PWR \(USB Power System\)](#) ..... 59
- Removed RTC\_B from LPM4.5 wake-up options in [Section 9.3, Operating Modes](#) ..... 63
- Throughout document, changed "bootstrap loader" to "bootloader"..... 67
- Added the paragraph that begins "Using the MSP430 RTC\_B Module With Battery Backup Supply describes how to..." ..... 72
- Corrected spelling of NMIIFG in [Table 9-12, System Module Interrupt Vector Registers](#) ..... 72
- Corrected register names (added "USB" prefix as required) in [Table 9-53, USB Control Registers](#) ..... 80
- Added P7SEL.2 and XT2BYPASS inputs with AND and OR gates in [Figure 9-10, Port P7 \(P7.3\) Diagram](#) 109
- Changed P7SEL.3 column from X to 0 for "P7.3 (I/O)" rows in [Table 9-63, Port P7 \(P7.2 and P7.3\) Pin Functions](#) ..... 109
- Updated [Table 9-67, Port PU.0, PU.1 Functions](#) ..... 116
- Added [Section 9.13.14, Port PU.0, PU.1 Ports \(F645x, F535x\)](#) ..... 118
- Added [Section 10, Device and Documentation Support](#), and moved *Development Tools Support*, *Device and Development Tool Nomenclature*, *Trademarks*, and *Electrostatic Discharge Caution* sections to it..... 122
- Replaced former section *Development Tools Support* with [Section 10.3, Tools and Software](#) ..... 124
- Added [Section 11, Mechanical, Packaging, and Orderable Information](#) ..... 129

- (1) For the most current device, package, and ordering information, see the *Package Option Addendum* in Section 11, or see the TI website at [www.ti.com](http://www.ti.com).
- (2) Package drawings, standard packing quantities, thermal data, symbolization, and PCB design guidelines are available at [www.ti.com/packaging](http://www.ti.com/packaging).
- (3) Each number in the sequence represents an instantiation of Timer\_A with its associated number of capture compare registers and PWM output generators available. For example, a number sequence of 3, 5 would represent two instantiations of Timer\_A, the first instantiation having 3 and the second instantiation having 5 capture compare registers and PWM output generators, respectively.
- (4) Each number in the sequence represents an instantiation of Timer\_B with its associated number of capture compare registers and PWM output generators available. For example, a number sequence of 3, 5 would represent two instantiations of Timer\_B, the first instantiation having 3 and the second instantiation having 5 capture compare registers and PWM output generators, respectively.
- (5) The additional 2KB of USB SRAM that is listed can be used as general-purpose SRAM when USB is not in use.

- (1) I = input, O = output, N/A = not available on this package offering
- (2) V<sub>CORE</sub> is for internal use only. No external current loading is possible. V<sub>CORE</sub> should only be connected to the recommended capacitor value, C<sub>V<sub>CORE</sub></sub>.
- (3) When this pin is configured as reset, the internal pullup resistor is enabled by default.

## 8 Specifications

All graphs in this section are for typical conditions, unless otherwise noted.

Typical (TYP) values are specified at  $V_{CC} = 3.3\text{ V}$  and  $T_A = 25^\circ\text{C}$ , unless otherwise noted.

### 8.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

	MIN	MAX	UNIT
Voltage applied at $V_{CC}$ to $V_{SS}$	-0.3	4.1	V
Voltage applied to any pin (excluding $V_{CORE}$ , $V_{BUS}$ , $V_{18}$ ) <sup>(2)</sup>	-0.3	$V_{CC} + 0.3$	V
Diode current at any device pin		$\pm 2$	mA
Storage temperature, $T_{stg}$ <sup>(3)</sup>	-55	150	$^\circ\text{C}$
Maximum junction temperature, $T_J$		95	$^\circ\text{C}$

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages referenced to  $V_{SS}$ .  $V_{CORE}$  is for internal device use only. No external DC loading or voltage should be applied.
- (3) Higher temperature may be applied during board soldering according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.

### 8.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	$\pm 1000$	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	$\pm 250$	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as  $\pm 1000\text{ V}$  may actually have higher performance.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as  $\pm 250\text{ V}$  may actually have higher performance.

$f_{SYSTEM\_USB}$	Minimum processor frequency for USB operation	1.5			MHz
USB_wait	Wait state cycles during USB operation		16		cycles

- (1) TI recommends powering AVCC and DVCC from the same source. A maximum difference of 0.3 V between AVCC and DVCC can be tolerated during power up and operation.
- (2) The minimum supply voltage is defined by the supervisor SVS levels when it is enabled. See the Section 8.23 threshold parameters for the exact values and further details.
- (3) A capacitor tolerance of ±20% or better is required.
- (4) The MSP430 CPU is clocked directly with MCLK. Both the high and low phase of MCLK must not exceed the pulse duration of the specified maximum frequency.
- (5) Modules may have a different maximum input clock specification. See the specification of the respective module in this data sheet.
- (6) USB operation with USB PLL enabled requires PMMCOREV<sub>x</sub> ≥ 2 for proper operation.

NOTE: The numbers within the fields denote the supported PMMCOREV<sub>x</sub> settings.

		BGA (ZQW)	72	
θ <sub>JB</sub>	Junction-to-board thermal resistance <sup>(3)</sup>	QFP (PZ)	98	°C/W
		BGA (ZQW)	76	

- (1) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, High-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
- (2) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
- (3) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.

- (1) Includes parasitic bond and package capacitance (approximately 2 pF per pin). Because the PCB adds additional capacitance, verify the correct load by measuring the ACLK frequency. For a correct setup, the effective load capacitance should always match the specification of the used crystal.
- (2) Requires external capacitors at both terminals. Values are specified by crystal manufacturers.
- (3) Measured with logic-level input frequency but also applies to operation with crystals.
- (4) Frequencies below the MIN specification set the fault flag. Frequencies above the MAX specification do not set the fault flag. Frequencies between the MIN and MAX specifications might set the flag.
- (5) To improve EMI on the XT1 oscillator, the following guidelines should be observed.
  - Keep the trace between the device and the crystal as short as possible.
  - Design a good ground plane around the oscillator pins.
  - Prevent crosstalk from other clock or data lines into oscillator pins XIN and XOUT.
  - Avoid running PCB traces underneath or adjacent to the XIN and XOUT pins.
  - Use assembly materials and processes that avoid any parasitic load on the oscillator XIN and XOUT pins.
  - If conformal coating is used, make sure that it does not induce capacitive or resistive leakage between the oscillator pins.
- (6) When XT1BYPASS is set, XT1 circuit is automatically powered down. Input signal is a digital square wave with parametrics defined in the Schmitt-trigger Inputs section of this data sheet.
- (7) Maximum frequency of operation of the entire device cannot be exceeded.
- (8) Oscillation allowance is based on a safety factor of 5 for recommended crystals. The oscillation allowance is a function of the XT1DRIVE<sub>x</sub> settings and the effective load. In general, comparable oscillator allowance can be achieved based on the following guidelines, but should be evaluated based on the actual crystal selected for the application:
  - For XT1DRIVE<sub>x</sub> = 0, C<sub>L,eff</sub> ≤ 6 pF
  - For XT1DRIVE<sub>x</sub> = 1, 6 pF ≤ C<sub>L,eff</sub> ≤ 9 pF
  - For XT1DRIVE<sub>x</sub> = 2, 6 pF ≤ C<sub>L,eff</sub> ≤ 10 pF
  - For XT1DRIVE<sub>x</sub> = 3, C<sub>L,eff</sub> ≥ 6 pF

- (1) Includes parasitic bond and package capacitance (approximately 2 pF per pin). Because the PCB adds additional capacitance, verify the correct load by measuring the ACLK frequency. For a correct setup, the effective load capacitance should always match the specification of the used crystal.
- (2) Requires external capacitors at both terminals. Values are specified by crystal manufacturers.
- (3) Measured with logic-level input frequency but also applies to operation with crystals.
- (4) Frequencies below the MIN specification set the fault flag. Frequencies above the MAX specification do not set the fault flag. Frequencies between the MIN and MAX specifications might set the flag.
- (5) To improve EMI on the XT2 oscillator the following guidelines should be observed.
  - Keep the traces between the device and the crystal as short as possible.
  - Design a good ground plane around the oscillator pins.
  - Prevent crosstalk from other clock or data lines into oscillator pins XT2IN and XT2OUT.
  - Avoid running PCB traces underneath or adjacent to the XT2IN and XT2OUT pins.
  - Use assembly materials and processes that avoid any parasitic load on the oscillator XT2IN and XT2OUT pins.
  - If conformal coating is used, make sure that it does not induce capacitive or resistive leakage between the oscillator pins.
- (6) When XT2BYPASS is set, the XT2 circuit is automatically powered down.
- (7) Maximum frequency of operation of the entire device cannot be exceeded.
- (8) Oscillation allowance is based on a safety factor of 5 for recommended crystals.

- (1) When selecting the proper DCO frequency range (DCORSELx), the target DCO frequency,  $f_{\text{DCO}}$ , should be set to reside within the range of  $f_{\text{DCO}(n,0),\text{MAX}} \leq f_{\text{DCO}} \leq f_{\text{DCO}(n,31),\text{MIN}}$ , where  $f_{\text{DCO}(n,0),\text{MAX}}$  represents the maximum frequency specified for the DCO frequency, range n, tap 0 (DCOx = 0) and  $f_{\text{DCO}(n,31),\text{MIN}}$  represents the minimum frequency specified for the DCO frequency, range n, tap 31 (DCOx = 31). This ensures that the target DCO frequency resides within the range selected. If the actual  $f_{\text{DCO}}$  frequency for the selected range causes the FLL or the application to select tap 0 or 31, the DCO fault flag is set to report that the selected range is at its minimum or maximum tap setting.

$t_{\text{WAKE-UP-RESET}}$	Wake-up time from RST or BOR event to active mode <sup>(4)</sup>			2	3	ms

(1) This value represents the time from the wake-up event to the first active edge of MCLK. The wake-up time depends on the performance mode of the low-side supervisor (SVS<sub>L</sub>) and low-side monitor (SVM<sub>L</sub>).  $t_{\text{WAKE-UP-FAST}}$  is possible with SVS<sub>L</sub> and SVM<sub>L</sub> in full performance mode or disabled. For specific register settings, see the *Low-Side SVS and SVM Control and Performance Mode Selection* section in the *Power Management Module and Supply Voltage Supervisor* chapter of the [MSP430F5xx and MSP430F6xx Family User's Guide](#).

(2) This value represents the time from the wake-up event to the first active edge of MCLK. The wake-up time depends on the performance mode of the low-side supervisor (SVS<sub>L</sub>) and low-side monitor (SVM<sub>L</sub>).  $t_{\text{WAKE-UP-SLOW}}$  is set with SVS<sub>L</sub> and SVM<sub>L</sub> in normal mode (low current mode). For specific register settings, see the *Low-Side SVS and SVM Control and Performance Mode Selection* section in the *Power Management Module and Supply Voltage Supervisor* chapter of the [MSP430F5xx and MSP430F6xx Family User's Guide](#).

(3) The wake-up times from LPM0 and LPM1 to AM are not specified. They are proportional to MCLK cycle time but are not affected by the performance mode settings as for LPM2, LPM3, and LPM4.

(4) This value represents the time from the wake-up event to the reset vector execution.

(1) The external reference voltage is selected by: SREF2 = 0, SREF1 = 0, SREF0 = 1.  $dV_{REF} = V_{R+} - V_{R-}$ .

(2) Parameters are derived using the histogram method.

(3) Parameters are derived using a best fit curve.

(4) The gain error and the total unadjusted error are dominated by the accuracy of the integrated reference module absolute accuracy. In this mode, the reference voltage used by the ADC12\_A is not available on a pin.

(1) The temperature sensor is provided by the REF module. See the REF module parametric,  $I_{REF+}$ , regarding the current consumption of the temperature sensor.

(2) The temperature sensor offset can be significant. TI recommends a single-point calibration to minimize the offset error of the built-in temperature sensor. The TLV structure contains calibration values for  $30^\circ\text{C} \pm 3^\circ\text{C}$  and  $85^\circ\text{C} \pm 3^\circ\text{C}$  for each of the available reference voltage levels. The sensor voltage can be computed as  $V_{SENSE} = TC_{SENSOR} \times (\text{Temperature}, ^\circ\text{C}) + V_{SENSOR}$ , where  $TC_{SENSOR}$  and

$V_{\text{SENSOR}}$  can be computed from the calibration values for higher accuracy. Also see the [MSP430F5xx and MSP430F6xx Family User's Guide](#).

- (3) The typical equivalent impedance of the sensor is 51 kΩ. The sample time required includes the sensor-on time  $t_{\text{SENSOR(on)}}$ .
- (4) The on-time  $t_{\text{VMID(on)}}$  is included in the sampling time  $t_{\text{VMID(sample)}}$ ; no additional on time is needed.

		$1.4 \text{ V} \leq V_{\text{eREF+}} \leq V_{\text{AVCC}}, V_{\text{eREF-}} = 0 \text{ V},$ $f_{\text{ADC12CLK}} = 5 \text{ MHz}, \text{ADC12SHTx} = 8\text{h},$ Conversion rate 20 ksps	2.2 V, 3 V	-1.2	+1.2	
$C_{\text{VREF+/-}}$	Capacitance at VREF+ or VREF- terminal <sup>(5)</sup>			10		$\mu\text{F}$

- (1) The external reference is used during ADC conversion to charge and discharge the capacitance array. The input capacitance,  $C_i$ , is also the dynamic load for an external reference during conversion. The dynamic impedance of the reference supply should follow the recommendations on analog-source impedance to allow the charge to settle for 12-bit accuracy.
- (2) The accuracy limits the minimum positive external reference voltage. Lower reference voltage levels may be applied with reduced accuracy requirements.
- (3) The accuracy limits the maximum negative external reference voltage. Higher reference voltage levels may be applied with reduced accuracy requirements.
- (4) The accuracy limits minimum external differential reference voltage. Lower differential reference voltage levels may be applied with reduced accuracy requirements.
- (5) Two decoupling capacitors, 10  $\mu\text{F}$  and 100 nF, should be connected to VREF to decouple the dynamic current required for an external reference source if it is used for the ADC12\_A. Also see the [MSP430F5xx and MSP430F6xx Family User's Guide](#).

- The reference is supplied to the ADC by the REF module and is buffered locally inside the ADC. The ADC uses two internal buffers, one smaller and one larger for driving the V<sub>REF+</sub> terminal. When REFOUT = 1, the reference is available at the V<sub>REF+</sub> terminal and is used as the reference for the conversion and uses the larger buffer. When REFOUT = 0, the reference is only used as the reference for the conversion and uses the smaller buffer.
- The internal reference current is supplied from the AV<sub>CC</sub> terminal. Consumption is independent of the ADC12ON control bit, unless a conversion is active. REFOUT = 0 represents the current contribution of the smaller buffer. REFOUT = 1 represents the current contribution of the larger buffer without external load.
- Contribution only due to the reference and buffer including package. This does not include resistance due to PCB trace or other causes.
- Calculated using the box method: (MAX(-40°C to 85°C) – MIN(-40°C to 85°C)) / MIN(-40°C to 85°C)/(85°C – (-40°C)).
- The condition is that the error in a conversion started after t<sub>REFON</sub> is less than ±0.5 LSB. The settling time depends on the external capacitive load when REFOUT = 1.

- (6) Two decoupling capacitors, 10  $\mu$ F and 100 nF, should be connected to VREF to decouple the dynamic current required for an external reference source if it is used for the ADC12\_A. Also see the [MSP430F5xx and MSP430F6xx Family User's Guide](#).
- (7) The temperature sensor is provided by the REF module. Its current is supplied from the AVCC terminal and is equivalent to I<sub>REF+</sub> with REFON = 1 and REFOUT = 0.
- (8) For devices without the ADC12, the parametric with ADC12SR = 0 are applicable.

t <sub>Retention</sub>	Data retention duration	25°C	100			years
t <sub>Word</sub>	Word or byte program time <sup>(2)</sup>		64		85	µs
t <sub>Block, 0</sub>	Block program time for first byte or word <sup>(2)</sup>		49		65	µs
t <sub>Block, 1–(N–1)</sub>	Block program time for each additional byte or word, except for last byte or word <sup>(2)</sup>		37		49	µs
t <sub>Block, N</sub>	Block program time for last byte or word <sup>(2)</sup>		55		73	µs
t <sub>Seg Erase</sub>	Erase time for segment, mass erase, and bank erase when available <sup>(2)</sup>		23		32	ms
f <sub>MCLK,MGR</sub>	MCLK frequency in marginal read mode (FCTL4.MGR0 = 1 or FCTL4.MGR1 = 1)		0		1	MHz

- (1) The cumulative program time must not be exceeded when writing to a 128-byte flash block. This parameter applies to all programming methods: individual word write, individual byte write, and block write modes.
- (2) These values are hardwired into the state machine of the flash controller.

## 8.58 JTAG and Spy-Bi-Wire Interface

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
f <sub>SBW</sub>	Spy-Bi-Wire input frequency	2.2 V, 3 V	0		20	MHz
t <sub>SBW,Low</sub>	Spy-Bi-Wire low clock pulse duration	2.2 V, 3 V	0.025		15	µs
t <sub>SBW,En</sub>	Spy-Bi-Wire enable time (TEST high to acceptance of first clock edge) <sup>(1)</sup>	2.2 V, 3 V			1	µs
t <sub>SBW,Rst</sub>	Spy-Bi-Wire return to normal operation time		15		100	µs
f <sub>TCK</sub>	TCK input frequency for 4-wire JTAG <sup>(2)</sup>	2.2 V	0		5	MHz
		3 V	0		10	
R <sub>internal</sub>	Internal pulldown resistance on TEST	2.2 V, 3 V	45	60	80	kΩ

- (1) Tools that access the Spy-Bi-Wire interface must wait for the t<sub>SBW,En</sub> time after pulling the TEST/SBWTCK pin high before applying the first SBWTCK clock edge.
- (2) f<sub>TCK</sub> may be restricted to meet the timing requirements of the module selected.

## 9 Detailed Description

### 9.1 CPU

The MSP430 CPU has a 16-bit RISC architecture that is highly transparent to the application. All operations, other than program-flow instructions, are performed as register operations in conjunction with seven addressing modes for source operand and four addressing modes for destination operand.

The CPU is integrated with 16 registers that provide reduced instruction execution time. The register-to-register operation execution time is one cycle of the CPU clock. Four of the registers, R0 to R3, are dedicated as program counter, stack pointer, status register, and constant generator, respectively. The remaining registers are general-purpose registers (see [Figure 9-1](#)).

Peripherals are connected to the CPU using data, address, and control buses. The peripherals can be managed with all instructions.

## 9.2 Instruction Set

The instruction set consists of the original 51 instructions with three formats and seven address modes and additional instructions for the expanded address range. Each instruction can operate on word and byte data. [Table 9-1](#) lists examples of the three types of instruction formats. [Table 9-2](#) lists the address modes.

**Table 9-1. Instruction Word Formats**

INSTRUCTION WORD FORMAT	EXAMPLE	OPERATION
Dual operands, source-destination	ADD R4,R5	R4 + R5 → R5
Single operands, destination only	CALL R8	PC → (TOS), R8 → PC
Relative jump, unconditional or conditional	JNE	Jump-on-equal bit = 0

**Table 9-2. Address Mode Descriptions**

ADDRESS MODE	S <sup>(1)</sup>	D <sup>(1)</sup>	SYNTAX	EXAMPLE	OPERATION
Register	+	+	MOV Rs,Rd	MOV R10,R11	R10 → R11
Indexed	+	+	MOV X(Rn),Y(Rm)	MOV 2(R5),6(R6)	M(2+R5) → M(6+R6)
Symbolic (PC relative)	+	+	MOV EDE,TONI		M(EDE) → M(TONI)
Absolute	+	+	MOV &MEM, &TCDAT		M(MEM) → M(TCDAT)
Indirect	+		MOV @Rn,Y(Rm)	MOV @R10,Tab(R6)	M(R10) → M(Tab+R6)
Indirect auto-increment	+		MOV @Rn+,Rm	MOV @R10+,R11	M(R10) → R11 R10 + 2 → R10
Immediate	+		MOV #X,TONI	MOV #45,TONI	#45 → M(TONI)

## 9.3 Operating Modes

The MCUs have one active mode and seven software-selectable low-power modes of operation. An interrupt event can wake up the device from any of the low-power modes, service the request, and restore back to the low-power mode on return from the interrupt program.

Software can configure the following operating modes:

- Active mode (AM)
  - All clocks are active
- Low-power mode 0 (LPM0)
  - CPU is disabled
  - ACLK and SMCLK remain active, MCLK is disabled
  - FLL loop control remains active
- Low-power mode 1 (LPM1)
  - CPU is disabled
  - FLL loop control is disabled
  - ACLK and SMCLK remain active, MCLK is disabled
- Low-power mode 2 (LPM2)
  - CPU is disabled
  - MCLK, FLL loop control, and DCOCLK are disabled
  - DC generator of the DCO remains enabled
  - ACLK remains active
- Low-power mode 3 (LPM3)
  - CPU is disabled
  - MCLK, FLL loop control, and DCOCLK are disabled
  - DC generator of the DCO is disabled
  - ACLK remains active
- Low-power mode 4 (LPM4)
  - CPU is disabled
  - ACLK is disabled
  - MCLK, FLL loop control, and DCOCLK are disabled
  - DC generator of the DCO is disabled
  - Crystal oscillator is stopped
  - Complete data retention
- Low-power mode 3.5 (LPM3.5)
  - Internal regulator disabled
  - No data retention
  - RTC enabled and clocked by low-frequency oscillator
  - Wake-up input from  $\overline{\text{RST}}/\text{NMI}$ , RTC\_B, P1, P2, P3, and P4
- Low-power mode 4.5 (LPM4.5)
  - Internal regulator disabled
  - No data retention
  - Wake-up input from  $\overline{\text{RST}}/\text{NMI}$ , P1, P2, P3, and P4

## 9.4 Interrupt Vector Addresses

The interrupt vectors and the power-up start address are in the address range 0FFFFh to 0FF80h (see [Table 9-3](#)). The vector contains the 16-bit address of the appropriate interrupt-handler instruction sequence.

- (1) Multiple source flags
- (2) Interrupt flags are in the module.
- (3) A reset is generated if the CPU tries to fetch instructions from within peripheral space or vacant memory space.  
(Non)maskable: the individual interrupt enable bit can disable an interrupt event, but the general interrupt enable bit cannot disable it.
- (4) Reserved interrupt vectors at addresses are not used in this device and can be used for regular program code if necessary. To maintain compatibility with other devices, TI recommends reserving these locations.
- (5) Only on devices with peripheral module USB (MSP430F665x and MSP430F565x)
- (6) Only on devices with peripheral module LCD\_B (MSP430F665x and MSP430F645x), otherwise reserved (MSP430F535x and MSP430F565x)

(1) N/A = Not available

(2) Only available on F6659, F6658, F5659, F5658 devices. USB RAM can be used as general-purpose RAM when not used for USB operation.

(3) Only available on F6459, F6458, F5359, F5358 devices.

## 9.6 Bootloader (BSL)

The BSL enables users to program the flash memory or RAM using various serial interfaces. Access to the device memory by the BSL is protected by an user-defined password. For complete description of the features of the BSL and its implementation, see the [MSP430 Flash Device Bootloader \(BSL\) User's Guide](#).

### 9.6.1 USB BSL

The devices MSP430F565x and MSP430F665x come preprogrammed with the USB BSL. Use of the USB BSL requires external access to six pins (see [Table 9-5](#)). In addition to these pins, the application must support external components necessary for normal USB operation; for example, the proper crystal on XT2IN and XT2OUT or proper decoupling.

**Table 9-5. USB BSL Pin Requirements and Functions**

DEVICE SIGNAL	BSL FUNCTION
RST/NMI/SBWDIO	Entry sequence signal
PU.0/DP	USB data terminal DP
PU.1/DM	USB data terminal DM
PUR	USB pullup resistor terminal
VBUS	USB bus power supply
VSSU	USB ground supply

#### Note

The default USB BSL evaluates the logic level of the PUR pin after a BOR reset. If it is pulled high externally, then the BSL is invoked. Therefore, unless the application is invoking the BSL, it is important to keep PUR pulled low after a BOR reset, even if BSL or USB is never used. TI recommends applying a 1-M $\Omega$  resistor to ground.

### 9.6.2 UART BSL

All devices without a USB module (MSP430F535x and MSP430F645x) come preprogrammed with the UART BSL. A UART BSL is also available for devices with USB module that can be programmed by the user into the BSL memory by replacing the preprogrammed, factory supplied, USB BSL. Use of the UART BSL requires external access to six pins (see [Table 9-6](#)).

**Table 9-6. UART BSL Pin Requirements and Functions**

DEVICE SIGNAL	BSL FUNCTION
RST/NMI/SBWDIO	Entry sequence signal
TEST/SBWTK	Entry sequence signal
P1.1	Data transmit
P1.2	Data receive
VCC	Power supply
VSS	Ground supply

## 9.7 JTAG Operation

### 9.7.1 JTAG Standard Interface

The MSP430 family supports the standard JTAG interface which requires four signals for sending and receiving data. The JTAG signals are shared with general-purpose I/O. The TEST/SBWTCK pin is used to enable the JTAG signals. In addition to these signals, the RST/NMI/SBWDIO is required to interface with MSP430 development tools and device programmers. [Table 9-7](#) lists the JTAG pin requirements. For further details on interfacing to development tools and device programmers, see the [MSP430 Hardware Tools User's Guide](#). For a complete description of the features of the BSL and its implementation, see [MSP430 Programming With the JTAG Interface](#).

**Table 9-7. JTAG Pin Requirements and Functions**

DEVICE SIGNAL	DIRECTION	FUNCTION
PJ.3/TCK	IN	JTAG clock input
PJ.2/TMS	IN	JTAG state control
PJ.1/TDI/TCLK	IN	JTAG data input, TCLK input
PJ.0/TDO	OUT	JTAG data output
TEST/SBWTCK	IN	Enable JTAG pins
RST/NMI/SBWDIO	IN	External reset
VCC		Power supply
VSS		Ground supply

### 9.7.2 Spy-Bi-Wire Interface

In addition to the standard JTAG interface, the MSP430 family supports the two wire Spy-Bi-Wire interface. Spy-Bi-Wire can be used to interface with MSP430 development tools and device programmers. [Table 9-8](#) lists the Spy-Bi-Wire interface pin requirements. For further details on interfacing to development tools and device programmers, see the [MSP430 Hardware Tools User's Guide](#). For a complete description of the features of the JTAG interface and its implementation, see [MSP430 Programming With the JTAG Interface](#).

**Table 9-8. Spy-Bi-Wire Pin Requirements and Functions**

RST/NMI/SBWDIO	IN, OUT	Spy-Bi-Wire data input and output
VCC		Power supply
VSS		Ground supply

## 9.8 Flash Memory

The flash memory can be programmed through the JTAG port, Spy-Bi-Wire (SBW), the BSL, or in-system by the CPU. The CPU can perform single-byte, single-word, and long-word writes to the flash memory. Features of the flash memory include:

- Flash memory has n segments of main memory and four segments of information memory (A to D) of 128 bytes each. Each segment in main memory is 512 bytes in size.
- Segments 0 to n may be erased in one step, or each segment may be individually erased.
- Segments A to D can be erased individually, or as a group with segments 0 to n. Segments A to D are also called *information memory*.
- Segment A can be locked separately.

## 9.9 Memory Integrity Detection (MID)

The MID is an add-on to the flash memory controller. MID provides additional functionality over the regular flash operation methods. The main purpose of the MID function is to gain higher reliability of flash content and overall system integrity in harsh environments and in application areas that require such features. The on-chip MID ROM contains the factory-programmed MID support software. This software package provides several software functions that allow an application to use all of the features of the MID.

The MID functionality can be enabled for different flash memory ranges. These memory ranges are selectable by the cw0 parameter of the MID function MidEnable() (see [Table 9-9](#)).

**Table 9-9. Address Range Coverage of cw0 Parameter of MidEnable() Function**

cw0.0	00FFFh to 008000h	00FFFh to 008000h

## 9.10 RAM

The RAM is made up of n sectors. Each sector can be completely powered down to save leakage; however, all data are lost. Features of the RAM include:

- RAM has n sectors. The size of a sector can be found in [Section 9.5](#).
- Each sector 0 to n can be complete disabled; however, data retention is lost.
- Each sector 0 to n automatically enters low-power retention mode when possible.
- For devices that contain USB memory, the USB memory can be used as normal RAM if USB is not required.

## 9.11 Backup RAM

The backup RAM provides a limited number of bytes of RAM that are retained during LPMx.5 and during operation from a backup supply if the battery backup system module is implemented.

There are 8 bytes of backup RAM available. It can be word-wise accessed by the control registers BAKMEM0, BAKMEM1, BAKMEM2, and BAKMEM3.

## 9.12 Peripherals

Peripherals are connected to the CPU through data, address, and control buses. Peripherals can be managed using all instructions. For complete module descriptions, see the [MSP430F5xx and MSP430F6xx Family User's Guide](#).

### 9.12.1 Digital I/O

Nine 8-bit I/O ports are implemented: P1 through P9 are complete, and port PJ contains four individual I/O ports.

- All individual I/O bits are independently programmable.
- Any combination of input, output, and interrupt conditions is possible.
- Programmable pullup or pulldown on all ports.
- Programmable drive strength on all ports.
- Edge-selectable interrupt input capability for all the eight bits of ports P1, P2, P3, and P4.
- Read and write access to port-control registers is supported by all instructions.
- Ports can be accessed byte-wise (P1 through P9) or word-wise in pairs (PA through PD).

### 9.12.2 Port Mapping Controller

The port mapping controller allows the flexible and reconfigurable mapping of digital functions to port P2. [Table 9-10](#) lists the available mappings, and [Table 9-11](#) lists the default settings.

**Table 9-10. Port Mapping Mnemonics and Functions**

### 9.12.3 Oscillator and System Clock

The clock system is supported by the Unified Clock System (UCS) module that includes support for a 32-kHz watch crystal oscillator (in XT1 LF mode; XT1 HF mode is not supported), an internal very-low-power low-frequency oscillator (VLO), an internal trimmed low-frequency oscillator (REFO), an integrated internal digitally controlled oscillator (DCO), and a high-frequency crystal oscillator (XT2). The UCS module is designed to meet the requirements of both low system cost and low power consumption. The UCS module features digital frequency locked loop (FLL) hardware that, in conjunction with a digital modulator, stabilizes the DCO frequency to a programmable multiple of the watch crystal frequency. The internal DCO provides a fast turnon clock source and stabilizes in 3  $\mu$ s (typical). The UCS module provides the following clock signals:

- Auxiliary clock (ACLK), sourced from a 32-kHz watch crystal (XT1), a high-frequency crystal (XT2), the internal low-frequency oscillator (VLO), the trimmed low-frequency oscillator (REFO), or the internal digitally-controlled oscillator DCO.
- Main clock (MCLK), the system clock used by the CPU. MCLK can be sourced by same sources available to ACLK.
- Sub-Main clock (SMCLK), the subsystem clock used by the peripheral modules. SMCLK can be sourced by same sources available to ACLK.
- ACLK/n, the buffered output of ACLK, ACLK/2, ACLK/4, ACLK/8, ACLK/16, ACLK/32.

#### 9.12.4 Power-Management Module (PMM)

The PMM includes an integrated voltage regulator that supplies the core voltage to the device and contains programmable output levels to provide for power optimization. The PMM also includes supply voltage supervisor (SVS) and supply voltage monitoring (SVM) circuitry, as well as brownout protection. The brownout circuit is implemented to provide the proper internal reset signal to the device during power-on and power-off. The SVS and SVM circuitry detects if the supply voltage drops below a user-selectable level and supports both supply voltage supervision (the device is automatically reset) and supply voltage monitoring (the device is not automatically reset). SVS and SVM circuitry is available on the primary supply and core supply.

#### 9.12.5 Hardware Multiplier (MPY)

The multiplication operation is supported by a dedicated peripheral module. The module performs operations with 32-, 24-, 16-, and 8-bit operands. The module supports signed and unsigned multiplication as well as signed and unsigned multiply-and-accumulate operations.

#### 9.12.6 Real-Time Clock (RTC\_B)

The RTC\_B module can be configured for real-time clock (RTC) or calendar mode providing seconds, minutes, hours, day of week, day of month, month, and year. Calendar mode integrates an internal calendar which compensates for months with less than 31 days and includes leap year correction. The RTC\_B also supports flexible alarm functions and offset-calibration hardware. The implementation on this device supports operation in LPM3.5 mode and operation from a backup supply.

[Using the MSP430 RTC\\_B Module With Battery Backup Supply](#) describes how to use the RTC\_B with battery backup supply functionality to retain the time and keep the RTC counting through loss of main power supply, as well as how to handle correct reinitialization when the main power supply is restored.

#### 9.12.7 Watchdog Timer (WDT\_A)

The primary function of the WDT\_A module is to perform a controlled system restart after a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the module can be configured as an interval timer and can generate interrupts at selected time intervals.

#### 9.12.8 System Module (SYS)

The SYS module handles many of the system functions within the device. These include power-on reset and power-up clear handling, NMI source selection and management, reset interrupt vector generators, bootloader entry mechanisms, and configuration management (device descriptors). SYS also includes a data exchange mechanism using JTAG called a JTAG mailbox that can be used in the application. [Table 9-12](#) lists the SYS module interrupt vector registers.

**Table 9-12. System Module Interrupt Vector Registers**

### 9.12.9 DMA Controller

The DMA controller allows movement of data from one memory address to another without CPU intervention. For example, the DMA controller can be used to move data from the ADC12\_A conversion memory to RAM. Using the DMA controller can increase the throughput of peripheral modules. The DMA controller reduces system power consumption by allowing the CPU to remain in sleep mode, without having to awaken to move data to or from a peripheral.

The USB timestamp generator also uses the channel 0, 1, and 2 DMA trigger assignments described in [Table 9-13](#). The USB timestamp generator is available only on devices with the USB module (MSP430F565x and MSP430F665x).

- (2) Only on devices with peripheral module USB (MSP430F565x and MSP430F665x), otherwise reserved (MSP430F535x and MSP430F645x).

### 9.12.10 Universal Serial Communication Interface (USCI)

The USCI modules are used for serial data communication. The USCI module supports synchronous communication protocols such as SPI (3- or 4-pin) and I<sup>2</sup>C, and asynchronous communication protocols such as UART, enhanced UART with automatic baudrate detection, and IrDA. Each USCI module contains two portions, A and B.

The USCI\_An module provides support for SPI (3- or 4-pin), UART, enhanced UART, or IrDA.

The USCI\_Bn module provides support for SPI (3- or 4-pin) or I<sup>2</sup>C.

These MCUs include three complete USCI modules (n = 0 to 2).

### 9.12.11 Timer TA0

Timer TA0 is a 16-bit timer/counter (Timer\_A type) with five capture/compare registers. TA0 supports multiple capture/comparers, PWM outputs, and interval timing (see [Table 9-14](#)). TA0 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

### 9.12.12 Timer TA1

Timer TA1 is a 16-bit timer/counter (Timer\_A type) with three capture/compare registers. TA1 supports multiple capture/comparisons, PWM outputs, and interval timing (see [Table 9-15](#)). TA1 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

### 9.12.13 Timer TA2

Timer TA2 is a 16-bit timer/counter (Timer\_A type) with three capture/compare registers. TA2 supports multiple capture/comparers, PWM outputs, and interval timing (see [Table 9-16](#)). TA2 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

### 9.12.14 Timer TB0

Timer TB0 is a 16-bit timer/counter (Timer\_B type) with seven capture/compare registers. TB0 supports multiple capture/comparisons, PWM outputs, and interval timing (see Table 9-17). TB0 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

(1) Timer functions are selectable through the port mapping controller.

### 9.12.15 Comparator\_B

The primary function of the Comparator\_B module is to support precision slope analog-to-digital conversions, battery voltage supervision, and monitoring of external analog signals.

### 9.12.16 ADC12\_A

The ADC12\_A module supports fast 12-bit analog-to-digital conversions. The module implements a 12-bit SAR core, sample select control, reference generator, and a 16 word conversion-and-control buffer. The conversion-and-control buffer allows up to 16 independent ADC samples to be converted and stored without any CPU intervention.

### 9.12.17 DAC12\_A

The DAC12\_A module is a 12-bit R-ladder voltage-output DAC. The DAC12\_A may be used in 8-bit or 12-bit mode, and may be used in conjunction with the DMA controller. When multiple DAC12\_A modules are present, they may be grouped together for synchronous operation.

### 9.12.18 CRC16

The CRC16 module produces a signature based on a sequence of entered data values and can be used for data checking purposes. The CRC16 module signature is based on the CRC-CCITT standard.

### 9.12.19 Voltage Reference (REF) Module

The REF module generates all critical reference voltages that can be used by the various analog peripherals in the device.

### 9.12.20 LCD\_B

The LCD\_B driver generates the segment and common signals that are required to drive a liquid crystal display (LCD). The LCD\_B controller has dedicated data memories to hold segment drive information. Common and segment signals are generated as defined by the mode. Static, 2-mux, 3-mux, and 4-mux LCDs are supported. The module can provide a LCD voltage independent of the supply voltage with its integrated charge pump. It is possible to control the level of the LCD voltage, and thus contrast, by software. The module also provides an automatic blinking capability for individual segments.

The LCD\_B module is available only on the MSP430F665x and MSP430F645x devices.

### 9.12.21 USB Universal Serial Bus

The USB module is a fully integrated USB interface that is compliant with the USB 2.0 specification. The module supports full-speed operation of control, interrupt, and bulk transfers. The module includes an integrated LDO, PHY, and PLL. The PLL is highly flexible and supports a wide range of input clock frequencies. When USB RAM is not used for USB communication, it can be used by the system.

The USB module is available only on the MSP430F665x and MSP430F565x devices.

### 9.12.22 LDO and PU Port

The integrated 3.3-V power system incorporates an integrated 3.3-V LDO regulator that allows the entire MSP430 microcontroller to be powered from nominal 5-V LDO when it is made available for the system. Alternatively, the power system can supply power only to other components within the system, or it can be unused altogether.

The Port U Pins (PU.0 and PU.1) function as general-purpose high-current I/O pins. These pins can only be configured together as either both inputs or both outputs. Port U is supplied by the LDO rail. If the 3.3-V LDO is not being used in the system (disabled), the LDO pin can be supplied externally.

The LDO-PWR module (LDO and PU Port) is available on only the MSP430F645x and MSP430F535x devices.

### 9.12.23 Embedded Emulation Module (EEM) (L Version)

The EEM supports real-time in-system debugging. The L version of the EEM has the following features:

- Eight hardware triggers or breakpoints on memory access
- Two hardware triggers or breakpoints on CPU register write access
- Up to 10 hardware triggers can be combined to form complex triggers or breakpoints
- Two cycle counters
- Sequencer
- State storage
- Clock control on module level

### 9.12.24 Peripheral File Map

## 10 Device and Documentation Support

### 10.1 Getting Started and Next Steps

For more information on the MSP430™ family of devices and the tools and libraries that are available to help with your development, visit the [MSP430 ultra-low-power sensing and measurement MCUs overview](#).

### 10.2 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all MSP MCU devices. Each MSP MCU commercial family member has one of two prefixes: MSP or XMS. These prefixes represent evolutionary stages of product development from engineering prototypes (XMS) through fully qualified production devices (MSP).

**XMS** – Experimental device that is not necessarily representative of the final device's electrical specifications

**MSP** – Fully qualified production device

XMS devices are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

MSP devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (XMS) have a greater failure rate than the standard production devices. TI recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the temperature range, package type, and distribution format. [Figure 10-1](#) provides a legend for reading the complete device name.

**Figure 10-1. Device Nomenclature**

## 10.3 Tools and Software

All MSP microcontrollers are supported by a wide variety of software and hardware development tools. Tools are available from TI and various third parties. See them all at [MSP430 ultra-low-power MCUs – Design & development](#).

Table 10-1 lists the debug features of the MSP430F665x, MSP430F645x, MSP430F565x, and MSP430F535x MCUs. See the [Code Composer Studio IDE for MSP430 MCUs User's Guide](#) for details on the available features.

## Design Kits and Evaluation Modules

### [MSP-TS430PZ100USB - 100-pin Target Development Board for MSP430F5x and MSP430F6x MCUs](#)

The MSP-TS430PZ100USB is a stand-alone 100-pin ZIF socket target board used to program and debug the MSP430 MCU in-system through the JTAG interface or the Spy Bi-Wire (2-wire JTAG) protocol.

### [100-pin Target Development Board and MSP-FET Programmer Bundle for MSP430F5x and MSP430F6x MCUs](#)

The MSP-TS430PZ100USB is a stand-alone 100-pin ZIF socket target board used to program and debug the MSP430 MCU in-system through the JTAG interface or the Spy Bi-Wire (2-wire JTAG) protocol. The MSP-FET is a powerful flash emulation tool to quickly begin application development on the MSP430 MCU. It includes USB debugging interface used to program and debug the MSP430 in-system through the JTAG interface or the pin saving Spy Bi-Wire (2-wire JTAG) protocol.

### [MSP430F5529 USB LaunchPad Evaluation Kit](#)

Develop low power, PC-connected applications with integrated Full-speed USB 2.0 (HID/MSC/CDC). The MSP-EXP430F5529LP LaunchPad is an inexpensive, simple microcontroller development kit for the MSP430F5529 USB microcontroller. It's an easy way to start developing on the MSP430 MCU, with an on-board emulation for programming and debugging, as well as buttons and LEDs for simple user interface.

## Software

### [MSP430Ware™ Software](#)

MSP430Ware software is a collection of code examples, data sheets, and other design resources for all MSP430 devices delivered in a convenient package. In addition to providing a complete collection of existing MSP430 MCU design resources, MSP430Ware software also includes a high-level API called MSP Driver Library. This library makes it easy to program MSP430 hardware. MSP430Ware software is available as a component of CCS or as a stand-alone package.

### [MSP430F665x, MSP430F565x Code Examples](#)

C code examples that configure each of the integrated peripherals for various application needs.

### [MSP Driver Library](#)

Driver Library's abstracted API keeps you above the bits and bytes of the MSP430 hardware by providing easy-to-use function calls. Thorough documentation is delivered through a helpful API Guide, which includes details on each function call and the recognized parameters. Developers can use Driver Library functions to write complete projects with minimal overhead.

## [MSP EnergyTrace™ Technology](#)

EnergyTrace technology for MSP430 microcontrollers is an energy-based code analysis tool that measures and displays the application's energy profile and helps to optimize it for ultra-low-power consumption.

## [ULP \(Ultra-Low Power\) Advisor](#)

ULP Advisor™ software is a tool for guiding developers to write more efficient code to fully utilize the unique ultra-low power features of MSP and MSP432 microcontrollers. Aimed at both experienced and new microcontroller developers, ULP Advisor checks your code against a thorough ULP checklist to squeeze every last nano amp out of your application. At build time, ULP Advisor will provide notifications and remarks to highlight areas of your code that can be further optimized for lower power.

## [IEC 60730 Software Package](#)

The IEC 60730 MSP430 software package was developed to be useful in assisting customers in complying with IEC 60730-1:2010 (Automatic Electrical Controls for Household and Similar Use – Part 1: General Requirements) for up to Class B products, which includes home appliances, arc detectors, power converters, power tools, e-bikes, and many others. The IEC 60730 MSP430 software package can be embedded in customer applications running on MSP430s to help simplify the customer's certification efforts of functional safety-compliant consumer devices to IEC 60730-1:2010 Class B.

## [Fixed Point Math Library for MSP](#)

The MSP IQmath and Qmath Libraries are a collection of highly optimized and high-precision mathematical functions for C programmers to seamlessly port a floating-point algorithm into fixed-point code on MSP430 and MSP432 devices. These routines are typically used in computationally intensive real-time applications where optimal execution speed, high accuracy, and ultra-low energy are critical. By using the IQmath and Qmath libraries, it is possible to achieve execution speeds considerably faster and energy consumption considerably lower than equivalent code written using floating-point math.

## [Floating Point Math Library for MSP430](#)

Continuing to innovate in the low power and low cost microcontroller space, TI brings you MSPMATHLIB. Leveraging the intelligent peripherals of our devices, this floating point math library of scalar functions brings you up to 26x better performance. Mathlib is easy to integrate into your designs. This library is free and is integrated in both Code Composer Studio and IAR IDEs. Read the user's guide for an in depth look at the math library and relevant benchmarks.

## **Development Tools**

### [Code Composer Studio™ Integrated Development Environment for MSP Microcontrollers](#)

Code Composer Studio is an integrated development environment (IDE) that supports all MSP microcontroller devices. Code Composer Studio comprises a suite of embedded software utilities used to develop and debug embedded applications. It includes an optimizing C/C++ compiler, source code editor, project build environment, debugger, profiler, and many other features. The intuitive IDE provides a single user interface taking you through each step of the application development flow. Familiar utilities and interfaces allow users to get started faster than ever before. Code Composer Studio combines the advantages of the Eclipse software framework with advanced embedded debug capabilities from TI resulting in a compelling feature-rich development environment for embedded developers. When using CCS with an MSP MCU, a unique and powerful set of plugins and embedded software utilities are made available to fully leverage the MSP microcontroller.

### [Command-Line Programmer](#)

MSP Flasher is an open-source shell-based interface for programming MSP microcontrollers through a FET programmer or eZ430 using JTAG or Spy-Bi-Wire (SBW) communication. MSP Flasher can download binary files (.txt or .hex) files directly to the MSP microcontroller without an IDE.

## MSP MCU Programmer and Debugger

The MSP-FET is a powerful emulation development tool – often called a debug probe – which allows users to quickly begin application development on MSP low-power microcontrollers (MCU). Creating MCU software usually requires downloading the resulting binary program to the MSP device for validation and debugging. The MSP-FET provides a debug communication pathway between a host computer and the target MSP. Furthermore, the MSP-FET also provides a Backchannel UART connection between the computer's USB interface and the MSP UART. This affords the MSP programmer a convenient method for communicating serially between the MSP and a terminal running on the computer. It also supports loading programs (often called firmware) to the MSP target using the BSL (bootloader) through the UART and I<sup>2</sup>C communication protocols.

## MSP-GANG Production Programmer

The MSP Gang Programmer is an MSP430 or MSP432 device programmer that can program up to eight identical MSP430 or MSP432 Flash or FRAM devices at the same time. The MSP Gang Programmer connects to a host PC using a standard RS-232 or USB connection and provides flexible programming options that allow the user to fully customize the process. The MSP Gang Programmer is provided with an expansion board, called the Gang Splitter, that implements the interconnections between the MSP Gang Programmer and multiple target devices. Eight cables are provided that connect the expansion board to eight target devices (through JTAG or Spy-Bi-Wire connectors). The programming can be done with a PC or as a stand-alone device. A PC-side graphical user interface is also available and is DLL-based.

## 10.4 Documentation Support

The following documents describe the MSP430F665x, MSP430F645x, MSP430F565x, and MSP430F535x MCUs. Copies of these documents are available on the Internet at [www.ti.com](http://www.ti.com).

### Receiving Notification of Document Updates

To receive notification of documentation updates—including silicon errata—go to the product folder for your device on [ti.com](http://ti.com) (for links to the product folders, see [Section 10.5](#)). In the upper right corner, click the "Alert me" button. This registers you to receive a weekly digest of product information that has changed (if any). For change details, check the revision history of any revised document.

### Errata

## User's Guides

### [MSP430F5xx and MSP430F6xx Family User's Guide](#)

Detailed information on the modules and peripherals available in this device family.

### [MSP430 Flash Devices Bootloader \(BSL\) User's Guide](#)

The MSP430 bootloader (BSL) lets users communicate with embedded memory in the MSP430 microcontroller during the prototyping phase, final production, and in service. Both the programmable memory (flash memory) and the data memory (RAM) can be modified as required. Do not confuse the bootloader with the bootstrap loader programs found in some digital signal processors (DSPs) that automatically load program code (and data) from external memory to the internal memory of the DSP.

### [MSP430 Programming With the JTAG Interface](#)

This document describes the functions that are required to erase, program, and verify the memory module of the MSP430 flash-based and FRAM-based microcontroller families using the JTAG communication port. In addition, it describes how to program the JTAG access security fuse that is available on all MSP430 devices. This document describes device access using both the standard 4-wire JTAG interface and the 2-wire JTAG interface, which is also referred to as Spy-Bi-Wire (SBW).

### [MSP430 Hardware Tools User's Guide](#)

This manual describes the hardware of the TI MSP-FET430 Flash Emulation Tool (FET). The FET is the program development tool for the MSP430 ultra-low-power microcontroller. Both available interface types, the parallel port interface and the USB interface, are described.

## Application Reports

### [MSP430 32-kHz Crystal Oscillators](#)

Selection of the right crystal, correct load circuit, and proper board layout are important for a stable crystal oscillator. This application report summarizes crystal oscillator function and explains the parameters to select the correct crystal for ultra-low-power operation. In addition, hints and examples for correct board layout are given. The document also contains detailed information on the possible oscillator tests to ensure stable oscillator operation in mass production.

### [MSP430 System-Level ESD Considerations](#)

System-level ESD has become increasingly demanding as silicon technology scales to lower voltages and the need for designing cost-effective and ultra-low-power components. This application report addresses ESD topics to help board designers and OEMs understand and design robust system-level designs. A few real-world system-level ESD protection design examples and their results are discussed.

## 10.7 Trademarks

MicroStar Junior™, MSP430™, MSP430Ware™, EnergyTrace™, ULP Advisor™, Code Composer Studio™, and E2E™ are trademarks of Texas Instruments.

All other trademarks are the property of their respective owners.

## 10.8 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## 10.9 Export Control Notice

Recipient agrees to not knowingly export or re-export, directly or indirectly, any product or technical data (as defined by the U.S., EU, and other Export Administration Regulations) including software, or any controlled product restricted by other applicable national regulations, received from disclosing party under nondisclosure obligations (if any), or any direct product of such technology, to any destination to which such export or re-export is restricted or prohibited by U.S. or other applicable laws, without obtaining prior authorization from U.S. Department of Commerce and other competent Government authorities to the extent required by those laws.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

NOTES:

- A. All linear dimensions are in millimeters.
- B. This drawing is subject to change without notice.
- C. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
- D. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
