24.	IC Pd	712.79 mW	Power	IC power dissipation
25.	L Pd	1.189 W	Power	Inductor power dissipation
26.	M1 Pd	2.312 W	Power	M1 MOSFET total power dissipation
27.	M1 PdCond	778.96 mW	Power	M1 MOSFET conduction losses
28.	M1 PdSw	1.533 W	Power	M1 MOSFET switching losses
29.	M2 Pd	743.69 mW	Power	M2 MOSFET total power dissipation
30.	M2 PdCond	527.11 mW	Power	M2 MOSFET conduction losses
31.	M2 PdSw	216.58 mW	Power	M2 MOSFET switching losses
32.	Total Pd	5.3 W	Power	Total Power Dissipation
33.	BOM Count	27	System Information	Total Design BOM count
34.	Duty Cycle	33.788 %	System Information	Duty cycle
35.	Efficiency	97.14 %	System Information	Steady state efficiency
36.	FootPrint	380.0 mm^2	System Information	Total Foot Print Area of BOM components
37.	Frequency	255.102 kHz	System Information	Switching frequency
38.	Iout	15.0 A	System Information	Iout operating point
39.	Mode	FCCM	System Information	Conduction Mode
40.	Pout	180.0 W	System Information	Total output power
41.	Total BOM	$5.39	System Information	Total BOM Cost

#	Name	Value	Category	Description
42.	Vin	36.0 V	System Information	Vin operating point
43.	Vin p-p	5.408 V	System Information	Peak-to-peak input voltage
44.	Vout	12.0 V	System Information	Operational Output Voltage
45.	Vout Actual	12.139 V	System Information	Vout Actual calculated based on selected voltage divider resistors
46.	Vout Tolerance	2.906 %	System Information	Vout Tolerance based on IC Tolerance (no load) and voltage divider resistors if applicable
47.	Vout p-p	125.645 mV	System Information	Peak-to-peak output ripple voltage

Design Inputs

Name	Value	Description
Iout	15.0	Maximum Output Current
VinMax	36.0	Maximum input voltage
VinMin	32.0	Minimum input voltage
Vout	12.0	Output Voltage
base_pn	LM25145	Base Product Number
source	DC	Input Source Type
Ta	30.0	Ambient temperature

WEBENCH® Assembly

Component Testing

Some published data on components in datasheets such as Capacitor ESR and Inductor DC resistance is based on conservative values that will guarantee that the components always exceed the specification. For design purposes it is usually better to work with typical values. Since this data is not always available it is a good practice to measure the Capacitance and ESR values of Cin and Cout, and the inductance and DC resistance of L1 before assembly of the board. Any large discrepancies in values should be electrically simulated in WEBENCH to check for instabilities and thermally simulated in WebTHERM to make sure critical temperatures are not exceeded.

Soldering Component to Board

If board assembly is done in house it is best to tack down one terminal of a component on the board then solder the other terminal. For surface mount parts with large tabs, such as the DPAK, the tab on the back of the package should be pre-tinned with solder, then tacked into place by one of the pins. To solder the tab town to the board place the iron down on the board while resting against the tab, heating both surfaces simultaneously. Apply light pressure to the top of the plastic case until the solder flows around the part and the part is flush with the PCB. If the solder is not flowing around the board you may need a higher wattage iron (generally 25W to 30W is enough).

Initial Startup of Circuit

It is best to initially power up the board by setting the input supply voltage to the lowest operating input voltage 32.0V and set the input supply's current limit to zero. With the input supply off connect up the input supply to Vin and GND. Connect a digital volt meter and a load if needed to set the minimum Iout of the design from Vout and GND. Turn on the input supply and slowly turn up the current limit on the input supply. If the voltage starts to rise on the input supply continue increasing the input supply current limit while watching the output voltage. If the current increases on the input supply, but the voltage remains near zero, then there may be a short or a component misplaced on the board. Power down the board and visually inspect for solder bridges and recheck the diode and capacitor polarities. Once the power supply circuit is operational then more extensive testing may include full load testing, transient load and line tests to compare with simulation results.

Load Testing

The setup is the same as the initial startup, except that an additional digital voltmeter is connected between Vin and GND, a load is connected between Vout and GND and a current meter is connected in series between Vout and the load. The load must be able to handle at least rated output power + 50% (7.5 watts for this design). Ideally the load is supplied in the form of a variable load test unit. It can also be done in the form of suitably large power resistors. When using an oscilloscope to measure waveforms on the prototype board, the ground leads of the oscilloscope probes should be as short as possible and the area of the loop formed by the ground lead should be kept to a minimum. This will help reduce ground lead inductance and eliminate EMI noise that is not actually present in the circuit.
