GENERAL PRODUCT INFORMATION:	
Product Description –	
This report is a reissue of CBTR Ref. No. OFF-4787302668-A-1; CB Test Certificate Ref. No. DK-52866-UL. No tests conducted under this investigation due to reissue of CB Test Report Ref. No. OFF-4787302668-A-1.	
All required tests were carried out under the original investigation. The equipment under test (EUT) is an IC including capacitor discharge function (ICX) intended for building-in audio/video, information and communication technology equipment.	
Only tests of 5.4.8 and G.16.2 are considered necessary. All tests were conducted on model TEA19162T/1.	
All tests were conducted on the evaluation board (EVB), including EUT and its associated circuitry, provided by applicant, with input voltage 240 Vac. For details, see circuit schematics of EVB in attachment.	
This product defines the range/specific value between the equivalent value of X-capacitors' groups and resistors as below curve equation ($Y=3.527 \cdot 10^{-8} \cdot X^{-1.506}$) in table for end product use:	

During the impuls tests of G.16.2, the fuse (F101), line filters (LF102) and varistors on EVB were short circuited. The impulse tests were conducted using capacitors (CX101, CX102) before BD and X-capacitors group after BD on EVB and resistors (R101, R102) on EVB. After impuls tests, all the short-circuited components were reinstalled for following tests of application of a.c. voltage and cycling of power on and off.

The rating of components on EVB:

- Bridge Diodes (BD101): 400V min., 1A;
- Current sensing Resistor (R107, R108): Total is 0.039~0.18Ω. The equivalent resistance value of R107 and R108;
- Resistors (R101, R102): Total Min.10MΩ (R101+R102). Protect unexpected inrush for ICX, it connects to IC SNSMANS pin;

X-capacitors (CX101,CX102 and capacitors group): 0.47μ~4.7μF. CX101 and CX102 before BD is 0.1μ~4.6μF; X-capacitors group after BD is Min. 0.1μF.

Model Differences –

All models are identical except for model designation.

Specification

General description

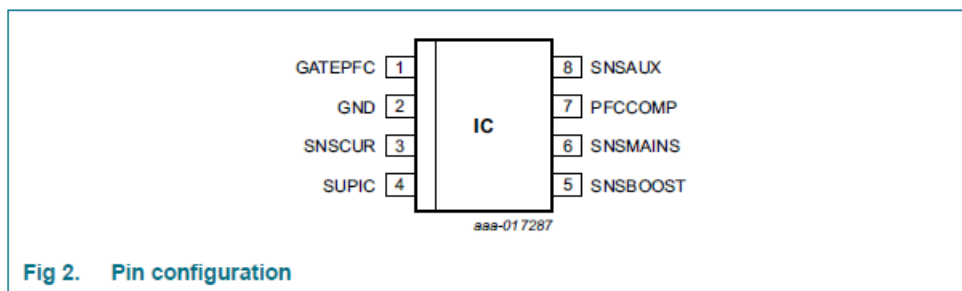

The TEA19162T and TEA19161T are combined controller (combo) ICs for resonant topologies including PFC. They provide high efficiency at all power levels. Together with the TEA1995T dual LLC resonant SR controller, a cost-effective resonant power supply can be built. This power supply meets the efficiency regulations of Energy Star, the Department of Energy (DoE), the Eco-design Directive of the European Union, the European Code of Conduct, and other guidelines.

The TEA19162T is a Power Factor Correction (PFC) controller. The IC communicates with the TEA19161T on start-up sequence and protections. It also enables a fast latch reset mechanism. To maximize the overall system efficiency, the TEA19161T allows setting the TEA19162T PFC to burst mode at a low output power level.

Using the TEA19161T and TEA19162T combo together with the TEA1995T secondary synchronous rectifier controller, a highly efficient and reliable power supply can be designed with a minimum of external components. The target output power is between 90 W and 500 W.

The system provides a very low no-load input power (< 75 mW; total system including the TEA19161T/TEA19162T combo and the TEA1995T) and high efficiency from minimum to maximum load. So, no additional low-power supply is required.

11. Application information

Capacitor C_{SUPIC} filters the IC supply voltage, which must be supplied externally. Sense resistor R_{sense} converts the current through the MOSFET M1 to a voltage on the SNSCUR pin. The R_{sense} value determines the maximum primary peak current in MOSFET M1.

To limit the current into the SNSCUR pin due to negative voltage spikes across the sense resistor, resistor R_{SNSCUR} is added.

To protect the IC from damage during lightning events, resistor R_{aux} is added.
