# High Frequency Planar Transformer

- Power Rating: up to 250W
- *Height:* 9.1mm to 10.4mm Max
- *Footprint:* 29.5mm x 26.7mm Max
- P Frequency Range: 200kHz to 700kHz
- Isolation (Primary to Secondary): 1750VDC

Notes: \*Inductance is measured, where applicable, with both primary windings connected in series (2 to 5, with 3 and 4 shorted).

\*\*Leakage inductance is measured with both primary windings connected in series (where applicable) with all other windings shorted.

### PA09XX Transformer Winding Configuration Matrix

The following is a matrix of the winding configurations that are possible with the Pulse PAO9XX Planar Transformer Platform. The package is typically capable of handling between 150-250W of power depending on the application, ambient conditions and available cooling. Once a configuration is selected, the formulae and charts can be used to determine the approximate power dissipation and temperature rise of the component in a given application.

#### Notes:

1. The primary inductance for any configuration can be calculated as: Primary Inductance ( $\mu$ H MIN) = 3.4 \* (Primary\_Turns)<sup>2</sup>

2. The above base part numbers (PA09XXNL) are available from stock.

3. It is possible to add a small gap to the transformer. Gapped transformers are

non-standard and can be made available upon request, but are not typically available from stock. To request a gapped version of the transformer, add a suffix "G" to the base number (i.e. PA0901**G**NL). The nominal inductance with the a gap can be calculated as: Primary Inductance (μH nominal) = 2.2 \* (Primary Turns)<sup>2</sup>

## High Frequency Planar Transformers

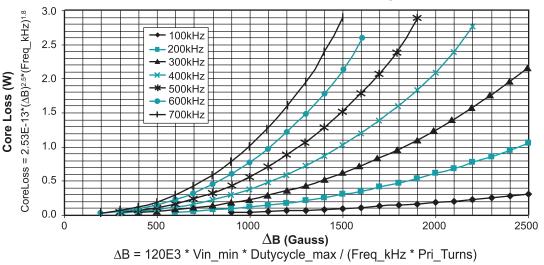

PA09XXNL Series (up to 250W)

#### **Notes from Tables**

 The above transformers have been tested and approved by Pulse's IC partners and are cited in the appropriate datasheet or evaluation board documentation at these companies. To determine which IC and IC companies are matched with the above transformers, please refer to the IC cross reference on the Pulse web page.

2. To determine if the transformer is suitable for your application, it is necessary to ensure that the temperature rise of the component (ambient plus temperature

rise) does not exceed its operating temperature. To determine the approximate temperature rise of the transformer, refer to the graphs below.

### Core Loss vs. Flux Density
