Operating Values

#	Name	Value	Category	Description
1.	BOM Count	17		Total Design BOM count
2.	Total BOM	\$3.049		Total BOM Cost
3.	Cin IRMS	242.711 mA	Capacitor	Input capacitor RMS ripple current
4.	Cin Pd	235.63 μ W	Capacitor	Input capacitor power dissipation
5.	Cout IRMS	111.846 mA	Capacitor	Output capacitor RMS ripple current
6.	Cout Pd	12.664 μ W	Capacitor	Output capacitor power dissipation
7.	D1 Tj	54.643 degC	Diode	D1 junction temperature
8.	Diode Pd	51.59 mW	Diode	Diode power dissipation
9.	IC Ipik	0.0 A	IC	Peak switch current in IC
10.	IC Pd	580.3 mW	IC	IC power dissipation
11.	IC Tj	86.269 degC	IC	IC junction temperature

#	Name	Value	Category	Description
12.	ICThetaJA	62.5 degC/W	IC	IC junction-to-ambient thermal resistance
13.	Iin Avg	1.208 A	IC	Average input current
14.	L Ipp	387.445 mA	Inductor	Peak-to-peak inductor ripple current
15.	L Pd	96.296 mW	Inductor	Inductor power dissipation
16.	Cin Pd	235.63 µW	Power	Input capacitor power dissipation
17.	Cout Pd	12.664 µW	Power	Output capacitor power dissipation
18.	Diode Pd	51.59 mW	Power	Diode power dissipation
19.	IC Pd	580.3 mW	Power	IC power dissipation
20.	L Pd	96.296 mW	Power	Inductor power dissipation
21.	Total Pd	728.4 mW	Power	Total Power Dissipation
22.	Cross Freq	26.709 kHz	System	Bode plot crossover frequency
23.	Duty Cycle	91.181 %	Information	Duty cycle
			System	
24.	Efficiency	93.298 %	Information	Steady state efficiency
			System	
25.	FootPrint	274.0 mm ²	Information	Total Foot Print Area of BOM components
			System	
26.	Frequency	282.408 kHz	Information	Switching frequency
			System	
27.	Gain Marg	-9.089 dB	Information	Bode Plot Gain Margin
			System	
28.	Iout	1.3 A	Information	Iout operating point
			System	
29.	Low Freq Gain	92.371 dB	Information	Gain at 1Hz
			System	
30.	Mode	CCM	Information	Conduction Mode
			System	
31.	Phase Marg	69.275 deg	Information	Bode Plot Phase Margin
			System	
32.	Pout	10.14 W	Information	Total output power
			System	
33.	Vin	9.0 V	Information	Vin operating point
			System	
34.	Vout	7.8 V	Information	Operational Output Voltage
			System	
35.	Vout Actual	7.875 V	Information	Vout Actual calculated based on selected voltage divider resistors
			System	
36.	Vout Tolerance	1.182 %	Information	Vout Tolerance based on IC Tolerance (no load) and voltage divider resistors if applicable
			System	
37.	Vout p-p	2.644 mV	Information	Peak-to-peak output ripple voltage
			System	

Design Inputs

Name	Value	Description
Iout	1.3	Maximum Output Current
VinMax	9.0	Maximum input voltage
VinMin	8.53	Minimum input voltage
Vout	7.8	Output Voltage
base_pn	TPS54260	Base Product Number
source	DC	Input Source Type
Ta	50.0	Ambient temperature

WEBENCH® Assembly

Component Testing

Some published data on components in datasheets such as Capacitor ESR and Inductor DC resistance is based on conservative values that will guarantee that the components always exceed the specification. For design purposes it is usually better to work with typical values. Since this data is not always available it is a good practice to measure the Capacitance and ESR values of C_{in} and C_{out} , and the inductance and DC resistance of $L1$ before assembly of the board. Any large discrepancies in values should be electrically simulated in WEBENCH to check for instabilities and thermally simulated in WebTHERM to make sure critical temperatures are not exceeded.

Soldering Component to Board

If board assembly is done in house it is best to tack down one terminal of a component on the board then solder the other terminal. For surface mount parts with large tabs, such as the DPAK, the tab on the back of the package should be pre-tinned with solder, then tacked into place by one of the pins. To solder the tab down to the board place the iron down on the board while resting against the tab, heating both surfaces simultaneously. Apply light pressure to the top of the plastic case until the solder flows around the part and the part is flush with the PCB. If the solder is not flowing around the board you may need a higher wattage iron (generally 25W to 30W is enough).

Initial Startup of Circuit

It is best to initially power up the board by setting the input supply voltage to the lowest operating input voltage 8.53V and set the input supply's current limit to zero. With the input supply off connect up the input supply to V_{in} and GND. Connect a digital volt meter and a load if needed to set the minimum load of the design from V_{out} and GND. Turn on the input supply and slowly turn up the current limit on the input supply. If the voltage starts to rise on the input supply continue increasing the input supply current limit while watching the output voltage. If the current increases on the input supply, but the voltage remains near zero, then there may be a short or a component misplaced on the board. Power down the board and visually inspect for solder bridges and recheck the diode and capacitor polarities. Once the power supply circuit is operational then more extensive testing may include full load testing, transient load and line tests to compare with simulation results.

Load Testing

The setup is the same as the initial startup, except that an additional digital voltmeter is connected between V_{in} and GND, a load is connected between V_{out} and GND and a current meter is connected in series between V_{out} and the load. The load must be able to handle at least rated output power + 50% (7.5 watts for this design). Ideally the load is supplied in the form of a variable load test unit. It can also be done in the form of suitably large power resistors. When using an oscilloscope to measure waveforms on the prototype board, the ground leads of the oscilloscope probes should be as short as possible and the area of the loop formed by the ground lead should be kept to a minimum. This will help reduce ground lead inductance and eliminate EMI noise that is not actually present in the circuit.

WEBENCH® Electrical Simulation Report

Design Id = 11
sim_id = 1
Simulation Type = Startup

Simulation Parameters

#	Name	Parameter Name	Description	Values
1.	Rload	R	Load Resistance	6.0 Ohm

Design Id = 11
sim_id = 2
Simulation Type = Load Transient

Simulation Parameters

#	Name	Parameter Name	Description	Values
1.	Cboot	IC	Initial Condition	8.765 V
2.	Cout	IC	Initial Voltage	7.8 V
3.	Iout	signal_type	Signal Type	PULSE
		I1	Initial Load Current	1.3 A
		I2	Minimum Load Current	0.13 A
		Td	Initial Time Delay	7.574850892064997E-4 s
		Tf	Fall Time	10u s
		Tr	Rise Time	10u s
		Pw	Pulse Width	5.965230328310346E-4 s

Design Id = 11
sim_id = 3
Simulation Type = Input Transient

Simulation Parameters

#	Name	Parameter Name	Description	Values
1.	Cboot	IC	Initial Condition	8.765 V
2.	L1	IC	Initial Current	1.3 A
3.	Cout	IC	Initial Voltage	7.8 V
4.	Rload	R	Load Resistance	6.0 Ohm

Design Id = 11
sim_id = 4
Simulation Type = Steady State

Simulation Parameters

#	Name	Parameter Name	Description	Values
1.	Cboot	IC	Initial Condition	10.0 V
2.	L1	IC	Initial Current	1.3 A
3.	Cout	IC	Initial Voltage	7.8 V
4.	Iout	I	Load Current	1.3 A
