Operating Values

#	Name	Value	Category	Description
1.	BOM Count	13		Total Design BOM count
2.	Total BOM	NA		Total BOM Cost
3.	Cin ESR	1.0 mOhm	Capacitor	Cin Capacitor ESR
4.	Cin IRMS	157.979 mA	Capacitor	Input capacitor RMS ripple current
5.	Cin Pd	24.957 µW	Capacitor	Input capacitor power dissipation
6.	Cinx ESR	1.0 mOhm	Capacitor	Cin Capacitor ESR
7.	Cinx IRMS	157.979 mA	Capacitor	Bulk capacitor RMS ripple current
8.	Cinx Pd	24.957 µW	Capacitor	Bulk capacitor power dissipation
9.	Cout ESR	1.0 mOhm	Capacitor	Cout Capacitor ESR
10.	IC Ipk	1.474 A	IC	Peak switch current in IC
11.	IC Pd	218.87 mW	IC	IC power dissipation

#	Name	Value	Category	Description
12.	IC Tj	37.354 degC	IC	IC junction temperature
13.	IC Tolerance	12.0 mV	IC	IC Feedback Tolerance
14.	ICThetaJA Effective	33.6 degC/W	IC	Effective IC Junction-to-Ambient Thermal Resistance
15.	Iin Avg	997.24 mA	IC	Average input current
16.	Ipp percentage	109.754 %	Inductor	Inductor ripple current percentage (with respect to average inductor current)
17.	L Ipp	1.095 A	Inductor	Peak-to-peak inductor ripple current
18.	L Pd	191.62 mW	Inductor	Inductor power dissipation
19.	L1 DCR	200.0 mOhm	Inductor	L1 DCR
20.	L1 Irms	978.815 mA	Inductor	Inductor ripple current
21.	Cin Pd	24.957 µW	Power	Input capacitor power dissipation
22.	Cinx Pd	24.957 µW	Power	Bulk capacitor power dissipation
23.	IC Pd	218.87 mW	Power	IC power dissipation
24.	L Pd	191.62 mW	Power	Inductor power dissipation
25.	Total Pd	410.901 mW	Power	Total Power Dissipation
26.	Cross Freq	3.568 kHz	System Information	Bode plot crossover frequency
27.	Duty Cycle	82.729 %	System Information	Duty cycle
28.	Efficiency	87.514 %	System Information	Steady state efficiency
29.	FootPrint	65.0 mm^2	System Information	Total Foot Print Area of BOM components
30.	Frequency	500.0 kHz	System Information	Switching frequency
31.	Gain Marg	-121.886 dB	System Information	Bode Plot Gain Margin
32.	Iout	160.0 mA	System Information	Iout operating point
33.	Iout transient step used for Cout calculations	80.0 mA	System Information	Custom Transient current step requirement that was used for Cout selection (A).
34.	Low Freq Gain	68.345 dB	System Information	Gain at 1Hz
35.	Mode	CCM	System Information	Conduction Mode
36.	Overshoot Value	233.409 µV	System Information	Theoretical Vout Overshoot Value
37.	Phase Marg	84.816 deg	System Information	Bode Plot Phase Margin
38.	Pout	2.88 W	System Information	Total output power
39.	Undershoot Value	888.889 µV	System Information	Theoretical Vout Undershoot Value
40.	Vin	3.3 V	System Information	Vin operating point
41.	Vin p-p	17.341 mV	System Information	Peak-to-peak input voltage
42.	Vout	17.848 V	System Information	Operational Output Voltage
43.	Vout Actual	17.848 V	System Information	Vout Actual calculated based on selected voltage divider resistors
44.	Vout Ripple requirement used for Cout calculations	1.0 %	System Information	Custom maximum output ripple requirement that was used for Cout selection(% of Vout).
45.	Vout Tolerance	3.991 %	System Information	Vout Tolerance based on IC Tolerance (no load) and voltage divider resistors if applicable
46.	Vout p-p	13.616 mV	System Information	Peak-to-peak output ripple voltage
47.	Vout transient requirement used for Cout calculations	3.0 %	System Information	Custom Transient voltage change requirement that was used for Cout selection (% of Vout).

Design Inputs

Name	Value	Description
Iout	160.0 m	Maximum Output Current
VinMax	3.3	Maximum input voltage
VinMin	3.3	Minimum input voltage
Vout	18.0	Output Voltage
base_pn	TPS61288	Base Product Number
source	DC	Input Source Type
Ta	30.0	Ambient temperature

WEBENCH® Assembly

Component Testing

Some published data on components in datasheets such as Capacitor ESR and Inductor DC resistance is based on conservative values that will guarantee that the components always exceed the specification. For design purposes it is usually better to work with typical values. Since this data is not always available it is a good practice to measure the Capacitance and ESR values of Cin and Cout, and the inductance and DC resistance of L1 before assembly of the board. Any large discrepancies in values should be electrically simulated in WEBENCH to check for instabilities and thermally simulated in WebTHERM to make sure critical temperatures are not exceeded.

Soldering Component to Board

If board assembly is done in house it is best to tack down one terminal of a component on the board then solder the other terminal. For surface mount parts with large tabs, such as the DPAK, the tab on the back of the package should be pre-tinned with solder, then tacked into place by one of the pins. To solder the tab town to the board place the iron down on the board while resting against the tab, heating both surfaces simultaneously. Apply light pressure to the top of the plastic case until the solder flows around the part and the part is flush with the PCB. If the solder is not flowing around the board you may need a higher wattage iron (generally 25W to 30W is enough).

Initial Startup of Circuit

It is best to initially power up the board by setting the input supply voltage to the lowest operating input voltage 3.3V and set the input supply's current limit to zero. With the input supply off connect up the input supply to Vin and GND. Connect a digital volt meter and a load if needed to set the minimum Iout of the design from Vout and GND. Turn on the input supply and slowly turn up the current limit on the input supply. If the voltage starts to rise on the input supply continue increasing the input supply current limit while watching the output voltage. If the current increases on the input supply, but the voltage remains near zero, then there may be a short or a component misplaced on the board. Power down the board and visually inspect for solder bridges and recheck the diode and capacitor polarities. Once the power supply circuit is operational then more extensive testing may include full load testing, transient load and line tests to compare with simulation results.

Load Testing

The setup is the same as the initial startup, except that an additional digital voltmeter is connected between Vin and GND, a load is connected between Vout and GND and a current meter is connected in series between Vout and the load. The load must be able to handle at least rated output power + 50% (7.5 watts for this design). Ideally the load is supplied in the form of a variable load test unit. It can also be done in the form of suitably large power resistors. When using an oscilloscope to measure waveforms on the prototype board, the ground leads of the oscilloscope probes should be as short as possible and the area of the loop formed by the ground lead should be kept to a minimum. This will help reduce ground lead inductance and eliminate EMI noise that is not actually present in the circuit.
