

# Using I<sup>2</sup>C Communications With the bq34110, bq35100, and bq34z100-G1 Series of Gas Gauges

Battery Management Solutions

### ABSTRACT

This application report provides examples that illustrate the bit-transaction details of  $I^2C$  commands used with TI's bq34xxx series and bq35xxx series battery fuel gauges. The first two examples provide detailed explanations of using  $I^2C$  commands to read standard parameters and *Control Subcommand* parameters. The first example shows how to implement a standard fuel gauge command that interrogates the gauge for reading cell voltage. The second example shows the added bit transitions required to access a *Control Subcommand*, specifically requesting firmware version information. Other  $I^2C$  commands can be executed in the same manner, using the methodology of these two examples. The final sections provide step-by-step examples using the *bqStudio PC Master Control Panel* to read and write parameters from these gauges.

# Example 1: Reading Cell Voltage

I<sup>2</sup>C commands are always initiated by the host with a START (S) bit sequence, immediately followed by a 7-bit I<sup>2</sup>C address with the most-significant bit (MSB) sent first. An eighth bit of 0 is sent by the host, indicating that the next byte to be sent will be a write to the gauge. For the bq34xxx series and bq35xxx series of parts, these 8 bits form the byte 0xAA. Once the start bit and address byte have been successfully received by the gauge, the gauge responds with an ACKNOWLEDGE (A) bit sequence. The gauge is now ready for the subsequent command directive from the host. Further descriptions of the control bit sequences are presented in the Glossary: Control-Bit-Sequence Definitions.

After the successful transmission of the I<sup>2</sup>C address and read or write bit, the gauge command code can be sent by the host, in this case 0x08 for the *Voltage()* command. The command code is actually a base address location within the gauge and must not be confused with the I<sup>2</sup>C address for the gauge. Once this location is sent by the host, the gauge responds by sending an ACKNOWLEDGE bit sequence and then executing the corresponding command subroutine. Even though two-byte locations are used for many gauge commands, writing to only the single byte is required to start gauge command processing. In this case, only 0x08 was written to the gauge, even though the command consists of the two consecutive command bytes 0x08 and 0x09. Most commands consist of two bytes, because the data is returned to these command locations and are also two bytes – the least-significant byte (LSB) is stored in the lower address (0x08), whereas the MSB is stored in the higher address (0x09). Like the I<sup>2</sup>C address data, the gauge command is sent MSB-first.

All trademarks are the property of their respective owners.

The host initiates the reading of the command data by sending a REPEAT START (Sr) bit sequence. This is immediately followed by the 7-bit I<sup>2</sup>C address of the gauge plus the read-bit directive (1), which together create the byte 0xAB. The gauge responds with an ACKNOWLEDGE bit sequence, then takes control of the data bus. The first data byte (LSB) is stored at the 0x08 location in the gauge and is strobed out by the gauge MSB-first. If the host responds with an ACKNOWLEDGE bit sequence, the gauge automatically increments the command location to 0x09, then strobes out the MSB stored there. If the host responds with a NO ACKNOWLEDGE (P or NACK) bit transmission, no further data is spooled to the host. The host terminates the present command packet by sending a STOP bit.

### **Example 2: Reading the Firmware Version**

Reading the firmware version is an example of using the bq34z100-G1 subcommands. Subcommands are unique, as they represent another level of depth into the gauge command structure. All subcommands are accessed through the paired command locations at 0x00 and 0x01 in the gauge. The subcommands are written LSB-first. Hence, to send the FW\_VERSION subcommand (0x0002), the host writes 0x02 to command location 0x00 and 0x00 to 0x01. Again, I<sup>2</sup>C always writes the MSB first. The format for address/command/data exchange between host and gauge is similar to the previous example and is shown in Figure 2. As in Example 1, the host initiates transmission with a START bit, followed by the gauge I<sup>2</sup>C address and a WRITE bit of 0 (0xAA). The gauge responds with an ACKNOWLEDGE, then the host specifies the command address of 0x00. Again, the gauge to set the subcommand code of 0x0002. Hence, the host sends the low byte of the subcommand (0x02). The gauge acknowledges. Then the host sends the high byte of the subcommand (0x00). The gauge issues an ACKNOWLEDGE. The host completes the writing process by issuing the STOP bit sequence. Now the gauge is prepared to return firmware information to the host.

Figure 2. I<sup>2</sup>C Subcommand Initiation Sequence

To start the reading process, the host proceeds in a manner similar to Example 1, by issuing a START (S) bit sequence, immediately followed by the 7-bit I<sup>2</sup>C address of the gauge and the eighth bit of 0 (altogether, 0xAA for the bq34z100-G1 device). The gauge responds with an ACKNOWLEDGE bit sequence. The host sends the *Control()* command of 0x00, and the gauge acknowledges. The gauge address location has now been set. To retrieve the data at 0x00 and 0x01, the host proceeds as before. It initiates the reading of the command data by sending a REPEATED START bit sequence. This is immediately followed by the 7-bit I<sup>2</sup>C address of the gauge plus the read-bit directive (1), which together create the byte 0xAB. The gauge responds with an ACKNOWLEDGE bit sequence, then takes control of the data bus. The first data byte (LSB) is stored at the 0x00 location in the gauge and is strobed out by the gauge MSB-first. If the host responds with an ACKNOWLEDGE bit sequence, the gauge automatically increments the command location to 0x01, then strobes out the MSB stored there. The host terminates the entire command location to 0x01, then strobes out the MSB stored there.

Figure 3. I<sup>2</sup>C Read Subcommand Sequence

### Standard I<sup>2</sup>C Commands

We will use the *Voltage* as an example. Its command code is 08/09. Use the *PC Master Control Panel* section to read the flash.

ENTER: Start Register 08, Number of Bytes to Read 2 and PRESS the Read button.

| Ľ | 2C Master Control Panel    |  |         |          |        |       |       |  |  |  |  |

Figure 4. Standard I<sup>2</sup>C Command Reading Voltage

Byte swap the data and convert it to decimal. 3C8C is 15500 mV.

## Extended I<sup>2</sup>C Commands

Read these like *Standard Commands*. As an example, use the *State-of-Health* (SOH), its command code is 2E/2F.

Use the PC Master Control Panel section to read the flash.

ENTER: Start Register 2E, Number of Bytes to Read 2, and PRESS the Read button.

Figure 5. Extended I<sup>2</sup>C Command Reading State-of-Health

Byte swap the data and convert it to decimal. 0062 is 98% SOH.

## **Control Subcommands**

## Example 1:

DEVICE\_TYPE Control() Subcommand 0001 and the correct answer is 0100 for the bq34z100-G1.

Use the I<sup>2</sup>C Master Control Panel section to read the flash.

ENTER: Start Register *00*, Bytes to Write *0100* and PRESS the **Write** button. The I<sup>2</sup>C words occur in the following order in the data stream: AA, 00, 01, 00.

ENTER: Start Register *00*, Number of Bytes to Read *2* and PRESS the **Read** button. The I<sup>2</sup>C words occur in the following order in the data stream: AA, 00, AB, 00, 01.

The device returns 0001, which is Little Endian for 0100. This is the DEVICE\_TYPE for the bq34z100-G1.

Figure 6. I<sup>2</sup>C Control Subcommand Reading DEVICE\_TYPE

# Example 2:

4

CHEM\_ID Control() Subcommand 0008 and the correct answer is 0107 for the bq34z100-G1.

Use the PC Master Control Panel section to read the flash.

ENTER: Start Register 00, Bytes to Write 0800 and PRESS the Write button.

The I<sup>2</sup>C words occur in the following order in the data stream: AA, 00, 08, 00.

ENTER: Start Register *00*, Number of Bytes to Read *2* and PRESS the **Read** button. The I<sup>2</sup>C words occur in the following order in the data stream: AA, 00, AB, 07, 01.

The device returns 0701, which is Little Endian for 0107. This is the default ChemID for the bq34z100-G1.

## Example 3:

FW\_VERSION Control() Subcommand 0002 returns both the DEVICE\_NUMBER and the FW\_VERSION on the bq34110 and bq35100. You must read 4 bytes of data.

Use the *PC Master Control Panel* section to read the flash.

ENTER: Start Register 3E, Bytes to Write 0200 and PRESS the Write button.

The  $I^2C$  words occur in the following order in the data stream: AA, 3E, 02, 00.

ENTER: Start Register *40*, Number of Bytes to Read *4* and PRESS the **Read** button. The I<sup>2</sup>C words occur in the following order in the data stream: AA, 40, AB, 01, 00, 01, 02.

The device returns 0100 0102 and it is not returned Little Endian. The DEVICE\_NUMBER is 0100 for the bq35100 and the FW\_VERSION is 0102.

Figure 8. I<sup>2</sup>C Control Subcommand Reading FW\_VERSION

## Data Flash Access for the bq34z100-G1

### Example 1:

6

Find the SubClass and Offset for the data that you want to read. We will use *Serial Number* for this example. SubClass 48, Offset 04 and it occupies 2 bytes.

Convert the SubClass HEX. 48 = 30H

Use the PC Master Control Panel section to read the flash.

Start Register 61, Bytes to Write 00 (Enable Flash x'fer command)

Start Register 3E, Bytes to Write 30 (SubClass address)

Start Register 3F, Bytes to Write 00 (Enable General Purpose Block)

Start Register 40, Number of Bytes to Read 20

The Serial number starts in the 5th byte. (0 is the first byte) The Serial Number is 0001 in this example.

### Figure 9. Data Flash Access Commands to Read the Serial Number

To read offset greater than 31, go to the next page; for example, I<sup>2</sup>C Command 3F, Byte 01

### Example 2:

Find the SubClass and Offset for the data you want to read. Using *Device Chemistry* for this example; SubClass 30, Offset 55, and it occupies 5 bytes. The Offset exceeds 32 bytes, so read the data from the 2<sup>nd</sup> page of the SubClass. The *Device Chemistry* will be located in bytes 24-29 of the 2<sup>nd</sup> page. The first byte is the number of bytes in the string.

Convert the SubClass HEX. 48 = 30H

Use the I<sup>2</sup>C Master Control Panel section to read the flash.

Start Register 61, Bytes to Write 00 (Enable Flash x'fer command)

Start Register 3E, Bytes to Write 30 (SubClass address)

Start Register 3F, Bytes to Write 01 (Enable General Purpose Block, 2<sup>nd</sup> page)

Start Register 40, Number of Bytes to Read 32

This is the data that was returned. The Device Chemistry starts in the 24th byte. (0 is the first byte) The 04 is the number of bytes currently programmed and 4C 49 4F 4E are ASCII for LION

62 71 33 34 7A 31 30 30 2D 47 31 0B 54 65 78 61 73 20 49 6E 73 74 2E 04 4C 49 4F 4E 00 00 00 00

We want to change LION to PbA and PbA is 50 62 41 in ASCII. The new string will be:

62 71 33 34 7a 31 30 30 2d 47 31 0b 54 65 78 61 73 20 49 6e 73 74 2e03 50 62 41 00 00 00 00 00

Where 03 is the number of bytes.

You will also need to calculate the checksum. Add the 32 bytes of data in hexadecimal and inverse the bits on the last byte to find the checksum. The string adds up to 7DC. The inverse of the last byte is 23, so this will be entered with the *60* command. Here is the full process to read the initial data flash contents, enter the new data and read the data flash to verify that it is correct.

### Figure 10. Data Flash Access Commands to Change the Device Chemistry Value

# Data Flash Access for the bq34110 and bq35100

Find the data flash address for the data that you want to read or change. Use the *Operation Config A* register on the bq35100 for this example. The parameter is located at 0z41b1 and it occupies 1 byte and can be found in the Technical Reference Manual (TRM) or on the *bqStudio Data Memory* screen.

Use the Advanced Comm section to read the data flash.

Start Register 3E, Bytes to Write b1 41 (data flash address)

Start Register 40, Number of Bytes to Read 01

The Operation Config A register is 80 in this example.

| [2( | C Master Control Panel                    |         |         |          |        |       |       |  |

|     |   |         |         |          |        |       |       |  |

# Figure 11. Data Flash Access Commands to Read the Operation Config A

Change the Operation Config A register to 0x82 to change to End-of Service mode.

Use the Advanced Comm section to write the data flash.

Start Register *3E*, Bytes to Write *b1 41* (data flash address)

Start Register 40, Byte to Write 82 (new data)

Start Register 60, Byte to Write 8b (checksum)

Start Register 61, Byte to Write 05 (length of data written)

The checksum is calculated by adding the starting address and the data in hexadecimal and the taking the inverse of the last byte. In the example, the checksum calculation will be 41 + b1 + 82 = 174. Inverse the last byte. 74 => 8b

The Length of Data Written is set to the number of bytes + 4. In this example it is set to 1 + 4 = 5.

Figure 12. Data Flash Access Commands to Change the Operation Config A

### Summary

In summary, remember the following critical aspects when implementing I<sup>2</sup>C communication between host and bq34xxx and bq35xxx gauges:

- 1. Handshaking between the host and gauge is performed by five bit sequences: START, REPEATSTART, ACKNOWLEDGE, NO ACKNOWLEDGE, and STOP.
- The I<sup>2</sup>C address and read/write bit is the first data item sent at the beginning of an I<sup>2</sup>C packet transmission. The I<sup>2</sup>C address must not be mistaken for the command address in the gauge, the latter being the second data field to be transmitted by the host.
- 3. The host initiates all communication to the gauge and uses the WRITE directive at the end of the I<sup>2</sup>C address (total byte is 0xAA). When followed by the gauge command, this sets the command address from which the host writes or reads gauge data.
- 4. When reading or writing multiple bytes, the host should use the base-address auto-increment feature of the gauge, rather than specifying the gauge address location each time a byte is transferred.
- 5. Whether command address or gauge data, all I<sup>2</sup>C data is transferred between host and gauge with the least-significant byte first.
- 6. All bytes transferred between host and gauge is transferred most-significant bit first.

### **Glossary: Control-Bit-Sequence Definitions**

**START:** The START-bit sequence is a host-generated bit that begins the transmission of every packet. It is defined by a high-to-low transition on the SDA line, while the SCL line is high.

**REPEAT START:** The REPEAT-START-bit sequence is also a host-generated bit. It has the same characteristics as the START bit, but appears in the middle of a packet transmission. It tells the slave that the gauge command (address) has been specified and data is ready for transfer to or from that command address.

**STOP:** The STOP-bit sequence indicates the end of a transmission packet. It is consists of a low-to-high transition of the SDA line, while the SCL line is high.

**ACKNOWLEDGE:** The ACKNOWLEDGE-bit sequence follows every (successful) data field sent between the host and gauge. The device receiving the data field is responsible for sending the bit sequence. The sequence consists of the SDA line being maintained in a low-status, while the SCL line is pulsed high.

**NO ACKNOWLEDGE:** The NO-ACKNOWLEDGE-bit sequence is frequently used by the host or gauge to indicate the last data byte has been transmitted/received, and that the host should terminate the packet with a STOP-bit sequence. It can also be used to indicate that an I<sup>2</sup>C device is not listening or capable of responding to the host at a given time. The sequence consists of the SDA line floating in a high state, while the SCL line is pulsed high.

### **IMPORTANT NOTICE**

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
