Design : 11895 TPS62808YKAR  
 TPS62808YKAR 2.3V-5.5V to 1.80V @ 0.6A

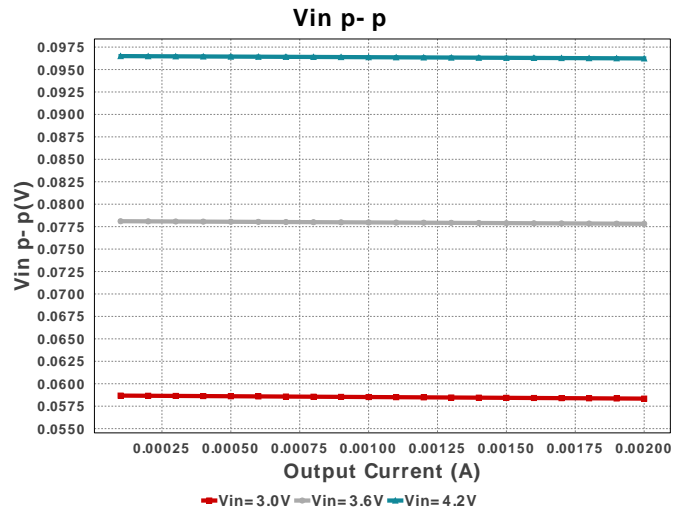

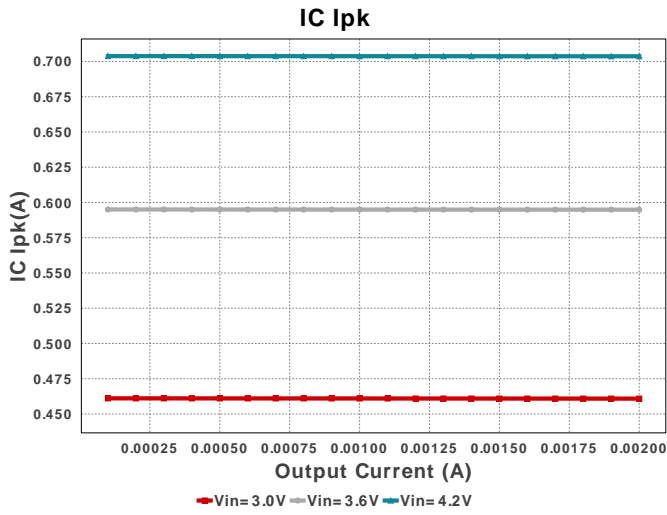

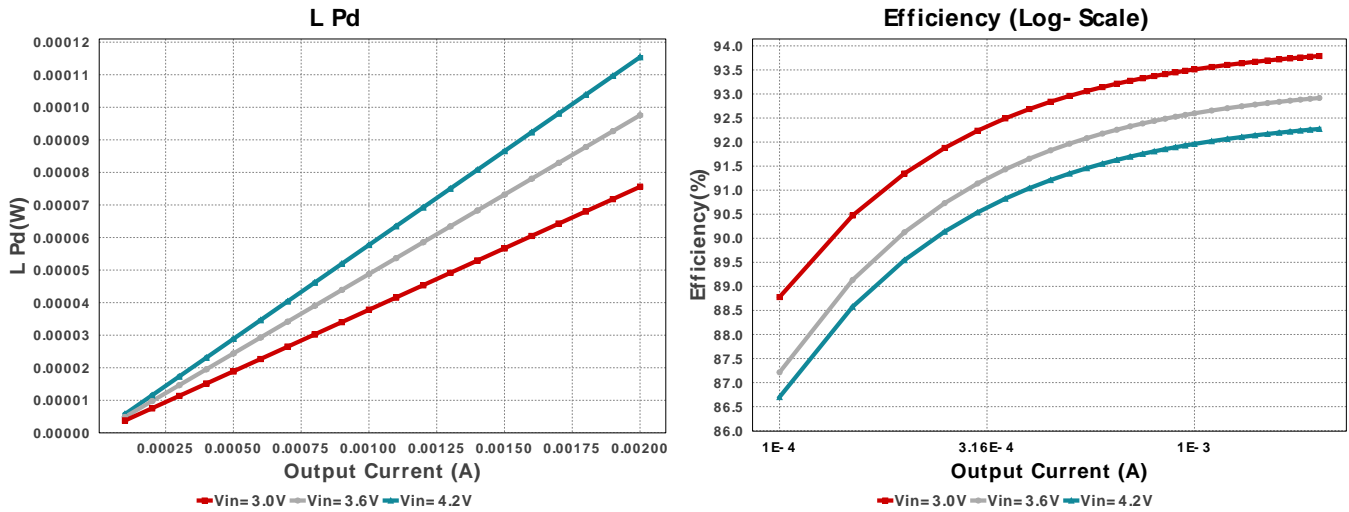

## Electrical BOM

Name	Manufacturer	Part Number	Properties	Qty	Price	Footprint
Cin	TDK	C1005X5R1A475K050BC Series= X5R	Cap= 4.7 uF ESR= 3.417 mOhm VDC= 10.0 V IRMS= 2.7063 A	1	\$0.10	0402_065 3 mm <sup>2</sup>
Cout	MuRata	GRM155R60G106ME44J Series= X5R	Cap= 10.0 uF ESR= 1.0 mOhm VDC= 4.0 V IRMS= 6.0 A	1	\$0.03	0402_070 3 mm <sup>2</sup>
L1	Taiyo Yuden	MCKK1608T1R0MN	L= 1.0 uH 123.0 mOhm	1	\$0.14	0603 5 mm <sup>2</sup>
U1	Texas Instruments	TPS62808YKAR	Switcher	1	\$0.36	YKA0006ACAC 4 mm <sup>2</sup>

## Operating Values

#	Name	Value	Category	Description
1.	Cin IRMS	20.258 mA	Capacitor	Input capacitor RMS ripple current
2.	Cin Pd	1.402 $\mu$ W	Capacitor	Input capacitor power dissipation
3.	Cout IRMS	30.564 mA	Capacitor	Output capacitor RMS ripple current
4.	Cout Pd	934.18 nW	Capacitor	Output capacitor power dissipation
5.	IC Ipk	703.657 mA	IC	Peak switch current in IC
6.	IC Pd	183.72 $\mu$ W	IC	IC power dissipation
7.	IC Tj	30.027 degC	IC	IC junction temperature
8.	ICThetaJA Effective	147.9 degC/W	IC	Effective IC Junction-to-Ambient Thermal Resistance
9.	Iin Avg	929.31 $\mu$ A	IC	Average input current
10.	L Ipp	703.66 mA	Inductor	Peak-to-peak inductor ripple current
11.	L Pd	115.4 $\mu$ W	Inductor	Inductor power dissipation
12.	Cin Pd	1.402 $\mu$ W	Power	Input capacitor power dissipation
13.	Cout Pd	934.18 nW	Power	Output capacitor power dissipation
14.	IC Pd	183.72 $\mu$ W	Power	IC power dissipation
15.	L Pd	115.4 $\mu$ W	Power	Inductor power dissipation
16.	Total Pd	303.076 $\mu$ W	Power	Total Power Dissipation
17.	BOM Count	4	System	Total Design BOM count
18.	Duty Cycle	249.111 m%	System	Duty cycle
19.	Efficiency	92.235 %	System	Steady state efficiency
20.	FootPrint	14.0 mm <sup>2</sup>	System	Total Foot Print Area of BOM components
21.	Frequency	8.495 kHz	System	Switching frequency
22.	Iout	2.0 mA	System	Iout operating point
23.	Mode	PFM	System	Conduction Mode
24.	Pout	3.6 mW	System	Total output power
25.	Total BOM	\$0.63	System	Total BOM Cost
26.	Vin	4.2 V	System	Vin operating point
27.	Vin p-p	96.238 mV	System	Peak-to-peak input voltage
28.	Vout	1.8 V	System	Operational Output Voltage
29.	Vout Tolerance	1.85 %	System	Vout Tolerance (no load, PWM mode)
30.	Vout p-p	40.496 mV	System	Peak-to-peak output ripple voltage

## Design Inputs

Name	Value	Description
Iout	2.0 m	Maximum Output Current
VinMax	4.2	Maximum input voltage
VinMin	3.0	Minimum input voltage
Vout	1.8	Output Voltage

---

Name	Value	Description
base_pn	TPS62808	Base Product Number
source	DC	Input Source Type
Ta	30.0	Ambient temperature

## WEBENCH® Assembly

### Component Testing

Some published data on components in datasheets such as Capacitor ESR and Inductor DC resistance is based on conservative values that will guarantee that the components always exceed the specification. For design purposes it is usually better to work with typical values. Since this data is not always available it is a good practice to measure the Capacitance and ESR values of  $C_{in}$  and  $C_{out}$ , and the inductance and DC resistance of L1 before assembly of the board. Any large discrepancies in values should be electrically simulated in WEBENCH to check for instabilities and thermally simulated in WebTHERM to make sure critical temperatures are not exceeded.

### Soldering Component to Board

If board assembly is done in house it is best to tack down one terminal of a component on the board then solder the other terminal. For surface mount parts with large tabs, such as the DPAK, the tab on the back of the package should be pre-tinned with solder, then tacked into place by one of the pins. To solder the tab down to the board place the iron down on the board while resting against the tab, heating both surfaces simultaneously. Apply light pressure to the top of the plastic case until the solder flows around the part and the part is flush with the PCB. If the solder is not flowing around the board you may need a higher wattage iron (generally 25W to 30W is enough).

### Initial Startup of Circuit

It is best to initially power up the board by setting the input supply voltage to the lowest operating input voltage 3.0V and set the input supply's current limit to zero. With the input supply off connect up the input supply to  $V_{in}$  and GND. Connect a digital volt meter and a load if needed to set the minimum load of the design from  $V_{out}$  and GND. Turn on the input supply and slowly turn up the current limit on the input supply. If the voltage starts to rise on the input supply continue increasing the input supply current limit while watching the output voltage. If the current increases on the input supply, but the voltage remains near zero, then there may be a short or a component misplaced on the board. Power down the board and visually inspect for solder bridges and recheck the diode and capacitor polarities. Once the power supply circuit is operational then more extensive testing may include full load testing, transient load and line tests to compare with simulation results.

### Load Testing

The setup is the same as the initial startup, except that an additional digital voltmeter is connected between  $V_{in}$  and GND, a load is connected between  $V_{out}$  and GND and a current meter is connected in series between  $V_{out}$  and the load. The load must be able to handle at least rated output power + 50% ( 7.5 watts for this design). Ideally the load is supplied in the form of a variable load test unit. It can also be done in the form of suitably large power resistors. When using an oscilloscope to measure waveforms on the prototype board, the ground leads of the oscilloscope probes should be as short as possible and the area of the loop formed by the ground lead should be kept to a minimum. This will help reduce ground lead inductance and eliminate EMI noise that is not actually present in the circuit.
