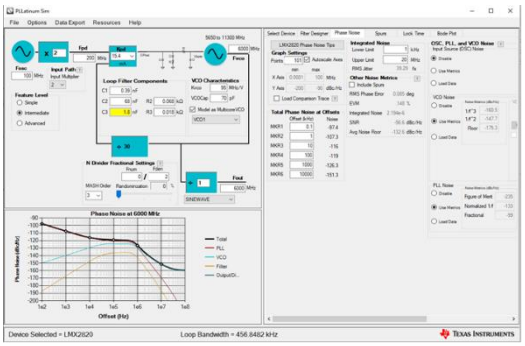
Featured clocks & timing tools

Clock tree architect design tool helps you select the right clocks & timing products to design a clock tree based on user entered output, input and system specifications. Along with the clock tree structure – it provides an approximate metric for power, area, jitter and other system parameters. Users are recommended to use the below tools to help with more accurate in-depth simulations, device programming, loop filter design and configuration.

PLLatinum Simulator Tool (PLLATINUMSIM-SW)

The PLLATINUMSIM-SW simulator tool lets you create detailed designs and simulations of our PLLATINUM™ integrated circuits which include the LMX series of PLLs and synthesizers. Users can design active and passive filters, do detailed simulations of phase noise, purs, lock time and bode plots.



TICS Pro Software (TICSPRO-SW)

The TICS Pro software is used to program the evaluation modules (EVMs) for device numbers with these prefixes: CDC, LMK and LMX. These devices include PLLs and voltage-controlled oscillators (PLL+VCO), synthesizers and clocking devices. Users can program EVMs through USB2ANY interface adaptor or onboard USB interface and export the programming configurations for use in end application. Even without an EVM, TICS Pro is very useful tool in determining and validating register configurations and how to set up the device.
