DACx0508 Octal, 16-, 14-, 12-Bit, SPI, Voltage Output DAC with Internal Reference

1 Features

- Performance
  - INL: ±1 LSB Maximum at 16-Bit Resolution
  - TUE: ±0.1% of FSR Maximum
- Integrated 2.5 V Precision Internal Reference
  - Initial Accuracy: ±5 mV Maximum
  - Low Drift: 2 ppm/°C Typical, DAC80508
- High Drive Capability: 20 mA with 0.5 V from Supply Rails
- Flexible Output Configuration
  - User Selectable Gain: 2, 1 or ½
  - Reset to Zero Scale or Midscale
  - Clear Output Function: DACx0508C
- Wide Operating Range
  - Power Supply: 2.7 V to 5.5 V
  - Temperature Range: –40˚C to 125˚C
- 50 MHz SPI Compatible Serial Interface
  - 1.7 V to 5.5 V Operation
  - Daisy Chain Operation
  - CRC Error Check
- Low Power: 0.6 mA/Channel at 5.5 V
- Small Packages:
  - 3 mm × 3 mm, 16-Pin WQFN
  - 2.4 mm x 2.4 mm, 16-Pin DSBGA

2 Applications

- Optical Networking
- Wireless Infrastructure
- Industrial Automation
- Data Acquisition Systems

3 Description

The DACx0508 is a pin-compatible family of low power, eight-channel, buffered voltage-output, digital-to-analog converters (DACs) with 16-, 14- and 12-bit resolution. The DACx0508 includes a 2.5-V, 5-ppm/°C internal reference, eliminating the need for an external precision reference in most applications. A user selectable gain configuration provides full-scale output voltages of 1.25 V (gain = ½), 2.5 V (gain = 1) or 5 V (gain = 2). The device operates from a single 2.7-V to 5.5-V supply, is specified monotonic and provides high linearity of ±1 LSB INL.

Communication to the DACx0508 is performed through a serial interface that operates at clock rates up to 50 MHz. The VIO pin enables serial interface operation from 1.7 V to 5.5 V. The DACx0508 flexible interface enables operation with a wide range of industry-standard microprocessors and microcontrollers.

The DACx0508 incorporates a power-on-reset circuit that powers up and maintains the DAC outputs at either zero scale or midscale until a valid code is written to the device. The device consumes low current of 0.6 mA/channel at 5.5 V, making it suitable for battery-operated equipment. A per-channel power-down feature reduces the device current consumption to 15 µA.

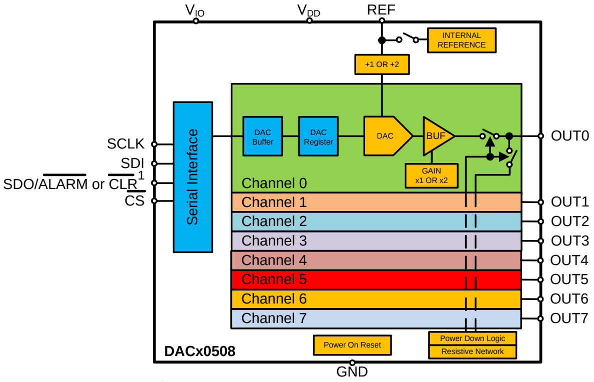
The DACx0508 is characterized for operation over the temperature range of –40°C to 125°C and is available in small packages.

Device Information[1]

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DACx0508	WQFN (16)	3.00 mm × 3.00 mm
	DSBGA (16)	2.40 mm x 2.40 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Simplified Block Diagram



[1] SDO/$\overline{\text{ALARM}}$ (DACx0508), $\overline{\text{CLR}}$ (DACx0508C)

An IMPORTANT NOTICE at the end of this data sheet addresses availability, warranty, changes, use in safety-critical applications, intellectual property matters and other important disclaimers. PRODUCTION DATA.

Table of Contents

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision C (April 2018) to Revision D	Page
• Changed TUE in Features from ±0.14% to 0.1%	1
• Changed Low Drift in Features from 5 ppm/°C to 2 ppm/°C and added DAC80508	1
• Added Clear Output Function: DACx0508C to Features	1
• Deleted 4-Wire Mode from Features	1
• Deleted 4-wire from second paragraph in Description	1
• Deleted DAC80508 Product Preview footnote from Device Information	1
• Deleted Product Preview from DAC80508Z and DAC80508M in Device Comparison Table	4
• Added DAC80508ZC and DAC80508MC to Device Comparison Table	4
• Added DAC60508ZC and DAC60508MC to Device Comparison Table	4
• Added DACx0508 to SDO/$\overline{\text{ALARM}}$ pin description in Pin Functions	5
• Added $\overline{\text{CLR}}$ pin (DACx0508C) in Pin Functions	5
• Changed SCLK, SDI, SDO/$\overline{\text{ALARM}}$ and $\overline{\text{CS}}$ to Digital pins for Pin voltage in Absolute Maximum Ratings	6
• Added Total unadjusted error, DAC80508. All Gains row in Electrical Characteristics	7
• Added Offset error, DAC80508. WQFN and BGA packages. All gains. row in Electrical Characteristics	7
• Added Full-scale error, DAC80508.All gains row in Electrical Characteristics	7
• Added Gain error, DAC80508 row in Electrical Characteristics	7
• Changed Short circuit current, DAC code = full scale. Output shorted to GND TYP from 35 mA to 30 mA in Electrical Characteristics	8
• Changed Short circuit current, DAC code = zero scale. Output shorted to V_{DD} TYP from 30 mA to 35 mA in Electrical Characteristics	8
• Added Channel to Channel DC crosstalk, DAC80508. Measured channel at midscale. Adjacent channel at full scale in Electrical Characteristics	8
• Added Channel to Channel DC crosstalk, DAC80508. Measured channel at midscale. All other channels at full scale in Electrical Characteristics	8
• Added Reference output drift, DAC80508 in Electrical Characteristics	9
• Added Reference thermal hysteresis, DAC80508. First cycle in Electrical Characteristics	9

Revision History (continued)

- Added SDO/$\overline{\text{ALARM}}$ to DIGITAL OUTPUTS heading in Electrical Characteristics ... 9
- Deleted I_{DD}, Power-down max value in Electrical Characteristics ... 9
- Changed Figure 1 to Figure 18 ... 10
- Changed Figure 20 to Figure 28 ... 12
- Changed Figure 34 ... 14
- Changed Figure 35 ... 14
- Changed Figure 37 ... 15
- Changed Figure 38 ... 15
- Added Figure 43 ... 16
- Added Figure 44 ... 16
- Changed Figure 58 ... 18
- Deleted 4-wire from paragraph in Overview section ... 20
- Added paragraph to Overview section ... 20
- Changed SDO/$\overline{\text{ALARM}}$ to SDO/$\overline{\text{ALARM}}$ or $\overline{\text{CLR}}$ in Functional Block Diagram ... 20
- Added CLEAR Operation (DACx0508C only) section ... 22
- Added Figure 61 ... 23
- Deleted four-wire from Programming section ... 28
- Added $\overline{\text{CLR}}$ pulse in Table 7 ... 28
- Added $\overline{\text{CLR}}$ delay and note in Table 7 ... 28
- Changed table note for Table 8 ... 30
- Added CLR-4TO7-MSK and CLR-0TO3-MSK bits for DACx0508C only to Figure 71 ... 34
- Added table note to Figure 71 ... 34
- Added CLR-4TO7-MSK and CLR-0TO3-MSK bits for DACx0508C only to Table 13 ... 34

Changes from Revision B (January 2018) to Revision C — Page

- Changed DAC80508Z, DAC70508Z, DAC60508Z, DAC80508M, DAC70508M, DAC60508M to DAC80508, DAC70508, DAC60508 in the data sheet header and footer ... 1
- Changed DAC80508Z and DAC80508M to DAC80508 in Device Information table note ... 1

Changes from Revision A (December 2017) to Revision B — Page

- Added 2.4 mm x 2.4 mm, 16-Pin DSBGA to Features ... 1
- Added DSBGA (16) package to Device Information ... 1
- Added DSBGA pinout ... 5
- Added DSBGA package pin number column to Pin Functions table ... 5
- Added DSBGA package pin number column to Pin Functions table ... 6
- Added YZF column to Thermal Information ... 7
- Added Offset error test conditions and DSBGA package specific row to Electrical Characteristics ... 7
- Added DSBGA Layout Example ... 42

Changes from Original (June 2017) to Revision A — Page

- Changed from Advance Information to Mixed Status ... 1

Pin Functions

PIN			TYPE	DESCRIPTION
NAME	WQFN NO.	DSBGA NO.		
REF	1	C1	I/O	When using internal reference, this is the reference output voltage pin (default). When using an external reference, this is the reference input pin to the device.
OUT0	2	C2	O	Analog output voltage from DAC 0.
OUT1	3	B1	O	Analog output voltage from DAC 1.
OUT2	4	B2	O	Analog output voltage from DAC 2.
OUT3	5	A1	O	Analog output voltage from DAC 3.
GND	6	A2	GND	Ground reference point for all circuitry on the device.
VDD	7	A3	PWR	Analog supply voltage (2.7 V to 5.5 V).
OUT4	8	A4	O	Analog output voltage from DAC 4.
OUT5	9	B4	O	Analog output voltage from DAC 5.
OUT6	10	B3	O	Analog output voltage from DAC 6.
OUT7	11	C3	O	Analog output voltage from DAC 7.
$\overline{\text{CS}}$	12	C4	I	Active low serial data enable. This input is the frame synchronization signal for the serial data. When the signal goes low, it enables the serial interface input shift register.
SCLK	13	D4	I	Serial interface clock.
SDI	14	D3	I	Serial interface data input. Data are clocked into the input shift register on each falling edge of the SCLK pin.
SDO/$\overline{\text{ALARM}}$	15	D2	O	DACx0508. Serial interface data output (default). The SDO pin is in high impedance when $\overline{\text{CS}}$ pin is high. Data are clocked out of the input shift register on either rising or falling edges of the SCLK pin as specified by the FSDO bit. Alternatively the pin can be configured as an $\overline{\text{ALARM}}$ open-drain output to indicate a CRC or reference alarm event. If configured as $\overline{\text{ALARM}}$ a 10 kΩ, pull-up resistor to V_{IO} is required.
$\overline{\text{CLR}}$			I	DACx0508C. A low value on the $\overline{\text{CLR}}$ pin causes the DAC outputs of those channels configured for clear operation to update their registers and output to the reset value: zero scale (DACx0508Z) or midscale (DACx0508M). Bringing the $\overline{\text{CLR}}$ pin high causes the device to exit clear mode.

Pin Functions (continued)

PIN			TYPE	DESCRIPTION
NAME	WQFN NO.	DSBGA NO.		
VIO	16	D1	PWR	IO supply voltage (1.7 V to 5.5 V). This pin sets the I/O operating voltage for the serial interface.
Thermal Pad	–	–	–	The thermal pad is located on the bottom-side of the WQFN package. The thermal pad should be connected to any internal PCB ground plane using multiple vias for good thermal performance.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) (1)

		MIN	MAX	UNIT
Suppy voltage	V_{DD} to GND	–0.3	6	V
	V_{IO} to GND	–0.3	6	
Pin voltage	DAC outputs to GND	–0.3	V_{DD} + 0.3	V
	REF to GND	–0.3	V_{DD} + 0.3	
	Digital pins to GND	–0.3	V_{IO} + 0.3	
Input current	Input current to any pin except supply pins	–10	10	mA
Temperature	Operating free-air, T_A	-40	125	°C
	Junction, T_J	–40	150	
	Storage, T_{stg}	–60	150	

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per JEDEC Standard 22 Test Method A114-C.01 (1)	±3000	V
		Charged-device model (CDM), per JEDEC Standard 22 Test Method C101, all pins (2)	±1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
POWER SUPPLY						
V_{DD}	Analog supply voltage		2.7		5.5	V
V_{IO}	IO supply voltage		1.7		5.5	
DIGITAL INPUTS						
	Digital input voltage		0		V_{IO}	V
REFERENCE INPUT						
V_{REFIN}	V_{DD} = 2.7 V to 3.3 V	Reference divider disabled	1.2		$(V_{DD} – 0.2)/2$	V
		Reference divider enabled	2.4		V_{DD} – 0.2	
	V_{DD} = 3.3 V to 5.5 V	Reference divider disabled	1.2		$V_{DD}/2$	
		Reference divider enabled	2.4		V_{DD}	
TEMPERATURE						
T_A	Operating free-air temperature		–40		125	°C

Copyright © 2017–2018, Texas Instruments Incorporated

7.4 Thermal Information

THERMAL METRIC(1)		DACx0508		UNIT
		RTE (WQFN)	YZF (DSBGA)	
		16 PINS	16 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	33.3	68.0	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	29.5	0.3	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	7.3	16.9	°C/W
ψ_{JT}	Junction-to-top characterization parameter	0.2	0.2	°C/W
ψ_{JB}	Junction-to-board characterization parameter	7.4	16.9	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	0.9	n/a	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.

7.5 Electrical Characteristics

All minimum and maximum specifications at V_{DD}= 2.7 V to 5.5 V, V_{IO} = 1.7 V to 5.5 V, V_{REFIN} = 1.25 V to 5.5 V, R_{LOAD} = 2 kΩ to GND, C_{LOAD} = 200 pF to GND, digital inputs at V_{IO} or GND, T_A = –40°C to 125°C (unless otherwise noted).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT

8 Detailed Description

8.1 Overview

The DACx0508 is a pin-compatible family of low-power, eight-channel, buffered voltage-output digital-to-analog converters (DACs) with 16-, 14- and 12-bit resolution. The DACx0508 includes a 2.5 V internal reference and user selectable gain configuration providing full scale output voltages of 1.25 V (gain = ½), 2.5 V (gain = 1) or 5 V (gain = 2). The device operates from a single 2.7 V to 5.5 V supply, is specified monotonic, and provides high linearity of ±1 LSB INL.

Communication to the DACx0508 is performed through a serial interface that supports stand-alone and daisy-chain operation. The optional frame-error checking provides added robustness to the DACx0508 serial interface.

The DACx0508 incorporates a power-on-reset circuit that powers up and maintains the DAC outputs at either zero scale or midscale until a valid code is written to the device.

A dedicated clear pin (DACx0508C) enables a simultaneous update of multiple DAC channels to their power-on-reset value.

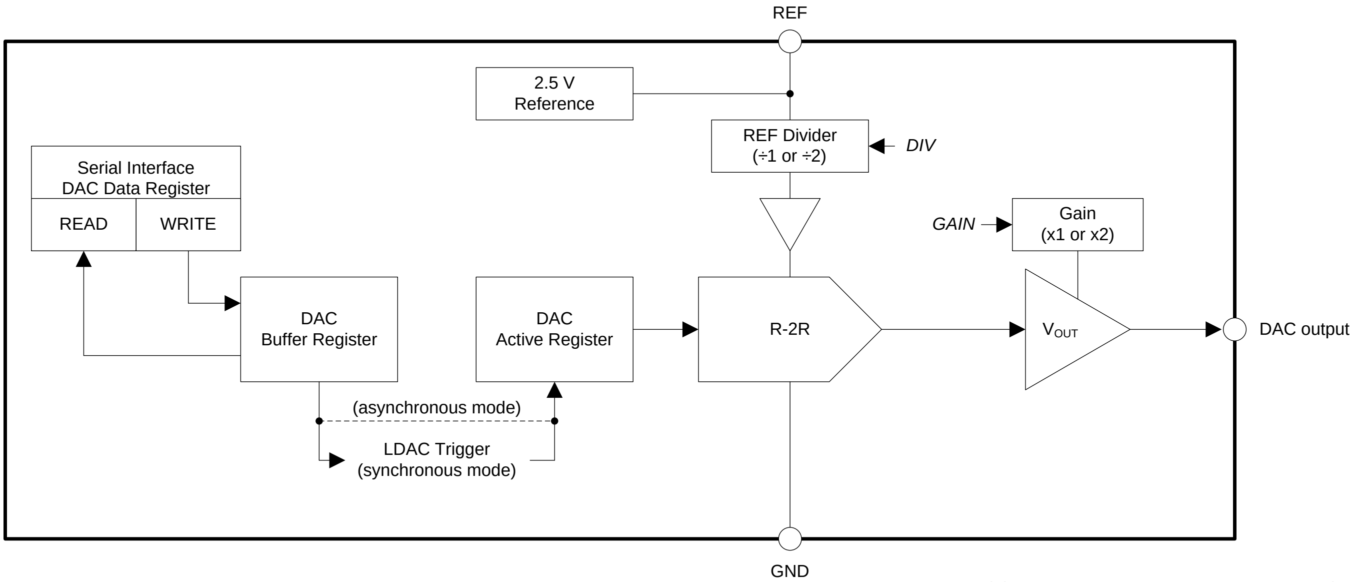
8.3 Feature Description

8.3.1 Digital-to-Analog Converter (DAC) Architecture

Each output channel in the DACx0508 consists of an R-2R ladder architecture followed by an output buffer amplifier. Figure 59 shows a block diagram of the DAC architecture.



Copyright © 2016, Texas Instruments Incorporated

Figure 59. DACx0508 DAC Block Diagram

8.3.1.1 DAC Transfer Function

The input data are written to the individual DAC Data registers in straight binary format. After a power-on or a reset event, all DAC registers are set to either zero code (DACx0508Z) or midscale code (DACx0508M). The DAC transfer function is given by Equation 1.

$$V_{OUT} = \frac{CODE}{2^n} \times \frac{V_{REF}}{DIV} \times GAIN \tag{1}$$

where:

CODE = decimal equivalent of the binary code that is loaded to the DAC register. CODE ranges from 0 to $2^n - 1$.

V_{REF} = DAC reference voltage. Either V_{REFOUT} from the internal 2.5 V reference or V_{REFIN} if using an external one.

n = resolution in bits. Either 12 (DAC60508), 14 (DAC70508) or 16 (DAC80508).

DIV = 1 or 2 as set by the REF-DIV bit in the GAIN register. Set to 1 by default.

GAIN = 1 or 2 as set by the BUFF-GAIN bit for that DAC channel in the GAIN register. Set to 1 by default in DACx0508Z and to 2 in DACx0508M.

Feature Description (continued)

8.3.1.2 Output Amplifiers

The DACx0508 output buffer amplifier is capable of generating rail-to-rail voltages on its output, giving a maximum output range of 0 V to V_{DD}. Each buffer amplifier is capable of driving a load of 2 kΩ in parallel with 10 nF to GND.

The full-scale output voltage for each channel is determined by the reference voltage (V_{REF}), the reference divider setting (DIV), and the output buffer gain for that channel (GAIN), as shown in Table 1. During normal operation the DIV and GAIN settings can be reconfigured through the REF-DIV and BUFF-GAIN bit (See Equation 1). The GAIN setting for each output channel can be individually configured thus enabling independent output voltage ranges for each DAC output.

Table 1. DAC Output Range Configuration

DIV Setting	GAIN Setting	DAC OUTPUT RANGE
÷2	×1	0 V to ½ × V_{REF}
÷1	×1	Not recommended
÷2	×2	0 V to V_{REF}
÷1	×2	0 V to 2 × V_{REF}

8.3.1.3 DAC Register Structure

Data written to the DAC data registers is initially stored in the DAC buffer registers. Transfer of data from the DAC buffer registers to the active DAC registers can be configured to happen immediately (asynchronous mode) or initiated by an LDAC trigger (synchronous mode). Once the DAC active registers are updated, the DAC outputs change to their new values. When the host reads from a DAC Data register, the value held in the DAC buffer register is returned (not the value held in the DAC active register).

8.3.1.3.1 DAC Register Synchronous and Asynchronous Updates

The update mode for each DAC channel is determined by the status of its corresponding SYNC-EN bit. In asynchronous mode, a write to the DAC data register results in an immediate update of the DAC active register and DAC output on $\overline{CS}$ rising edge. In synchronous mode, writing to the DAC data register does not automatically update the DAC output. Instead the update occurs only after an LDAC trigger event. An LDAC trigger is generated through the LDAC bit in the TRIGGER register. The synchronous update mode enables simultaneous update of multiple DAC outputs. In both update modes a minimum wait time of 1 µs is required between DAC output updates.

8.3.1.3.2 Broadcast DAC Register

The DAC broadcast register enables a simultaneous update of multiple DAC outputs with the same value with a single register write. Each DAC channel can be configured to update or remain unaffected by a broadcast command by setting the corresponding DAC-BRDCAST-EN bit in the SYNC register. A register write to the BRDCAST-DATA register forces those DAC channels that have been configured for broadcast operation to update their outputs. The DAC ouputs update to the broadcast value on $\overline{CS}$ rising edge independently of their synchronous mode configuration.

8.3.1.3.3 CLEAR Operation (DACx0508C only)

The $\overline{CLR}$ pin enables a simultaneous update of multiple DAC channels to the clear value: zero code (DACx0508ZC) or midscale code (DACx0508MC). DAC channels 0 through 3 and channels 4 through 7 can be independently configured to update or remain unaffected by the $\overline{CLR}$ pin by setting the corresponding CLR-MSK bit. A $\overline{CLR}$ pin logic low forces those DAC channels that have been configured for clear operation to clear the contents of their buffer and active registers to the clear value and sets the analog outputs accordingly, regardless of their synchronization setting. Those channels not configured for clear operation retain their buffer and active register contents as well as the corresponding analog outputs even if a clear command is issued. While the $\overline{CLR}$ pin is kept low, register writes to the DAC data registers of those channels set for clear operation are ignored. A logic high on the $\overline{CLR}$ pin causes the device to exit clear mode.

Copyright © 2017–2018, Texas Instruments Incorporated

8.3.2 Internal Reference

The DACx0508 includes a 2.5 V precision bandgap reference enabled by default. Operation from an external reference is supported by disabling the internal reference in the CONFIG register. The internal reference is externally available at the REF pin.

A minimum 150 nF capacitor is recommended between the reference output and GND for noise filtering.

8.3.2.1 Reference Divider

The reference voltage to the device, either from the internal reference or an external one can be divided by a factor of two by setting the REF-DIV bit in the GAIN register to 1 during normal operation. The reference voltage divider provides additional flexibility in setting the full-scale output voltage for each DAC output and must be configured so that there is sufficient headroom from V_{DD} to the DAC operating reference voltage (V_{REF}/DIV). See the Recommended Operating Conditions table for more information.

Improper configuration of the reference divider issues a reference alarm condition. In this case, the reference buffer is shut down, and all the DAC outputs go to 0 V. The DAC data registers are unaffected by the alarm condition thus enabling the DAC output to return to normal operation once the reference divider is configured correctly. The reference alarm status can be read from the REF-ALM bit in the STATUS register. Additionally by setting ALM-EN = 1 and ALM-SEL = 1 in the CONFIG register, the SDO/$\overline{\text{ALARM}}$ pin is configured as a reference alarm pin.

8.3.2.2 Solder Heat Reflow

A known behavior of IC reference voltage circuits is the shift induced by the soldering process. Figure 60 and Figure 61 show the effect of solder heat reflow for the DACx0508 internal reference.

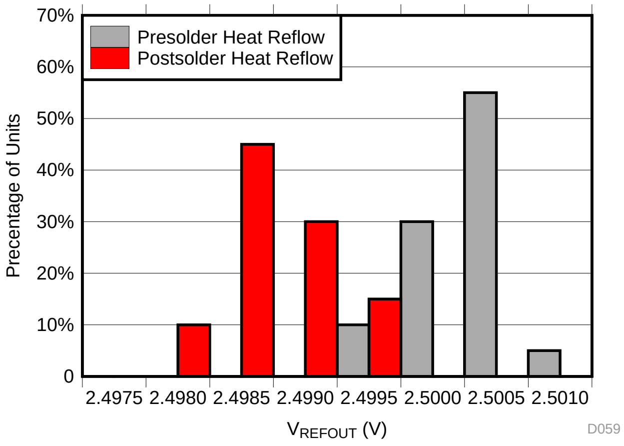


Figure 60. DAC70508 and DAC60508 Solder Heat Reflow Reference Voltage Shift

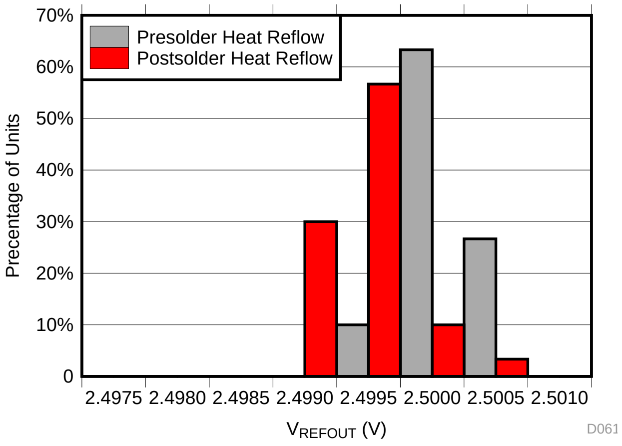

Figure 61. DAC80508 Solder Heat Reflow Reference Voltage Shift

8.3.3 Device Reset Options

8.3.3.1 Power-on-Reset (POR)

The DACx0508 includes a power-on reset function that controls the output voltage at power up. After the V_{DD} and V_{IO} supplies have been established a POR event is issued. The POR causes all registers to initialize to their default values and communication with the device is valid only after a 250 µs power-on-reset delay. The default value for all DACs in the DACx0508Z devices is zero-code and midscale-code for the DACx0508M ones. Each DAC channel remains at the power-up voltage until a valid command is written to it.

The POR circuit requires specific supply levels to discharge the internal capacitors and to reset the device on power up, as indicated in Figure 62 and Figure 63. In order to ensure a POR event, V_{DD} or V_{IO} must be below their corresponding low thresholds for at least 100 µs. If V_{DD} and V_{IO} remain above their specified high threshold a POR event will not occur. When the supplies drop below their high threshold but remain over the lower one (shown as the undefined region), the device may or may not reset under all specified temperature and power-supply conditions.

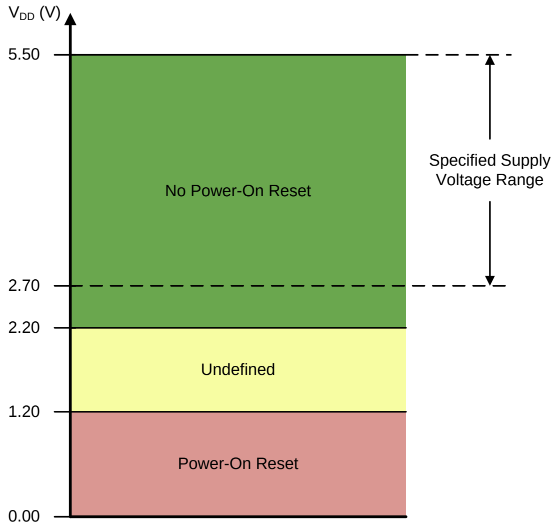

Figure 62. Threshold Levels for V_{DD} POR Circuit

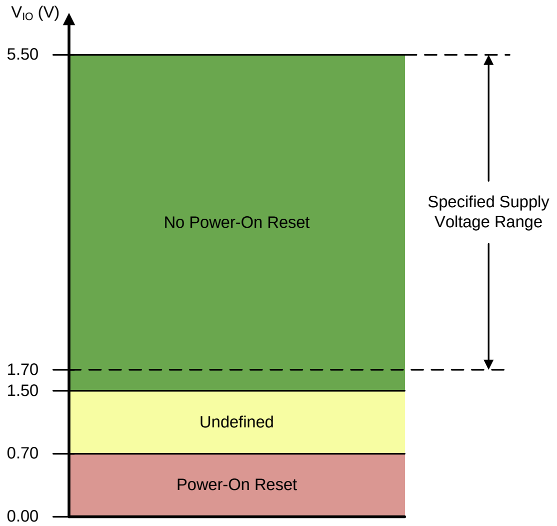

Figure 63. Threshold Levels for V_{IO} POR Circuit

8.3.3.2 Software Reset

A device software reset event is initiated by writing the reserved code 0x1010 to SOFT-RESET in the TRIGGER register. The software reset command is triggered on the $\overline{CS}$ rising edge of the instruction. A software reset initiates a POR event.

8.4 Device Functional Modes

8.4.1 Stand-Alone Operation

A serial interface access cycle is initiated by asserting the $\overline{CS}$ pin low. The serial clock SCLK can be a continuous or gated clock. SDI data are clocked on SCLK falling edges. A regular serial interface access cycle is 24 bits long with error checking disabled and 32 bits long with error checking enabled, thus the $\overline{CS}$ pin must stay low for at least 24 or 32 SCLK falling edges. The access cycle ends when the $\overline{CS}$ pin is de-asserted high. If the access cycle contains less than the minimum clock edges, the communication is ignored. If the access cycle contains more than the minimum clock edges, only the last 24 or 32 bits are used by the device. When $\overline{CS}$ is high, the SCLK and SDI signals are blocked and the SDO pin is in a Hi-Z state.

In an error checking disabled access cycle (24-bits long) the first byte input to SDI is the instruction cycle which identifies the request as a read or write command and the 4-bit address to be accessed. The following bits in the cycle form the data cycle, as shown in Table 2.

Table 2. Serial Interface Access Cycle

BIT	FIELD	DESCRIPTION
23	RW	Identifies the communication as a read or write command to the addressed register. R/W = 0 sets a write operation. R/W = 1 sets a read operation.
22:20	Reserved	Reserved bits. Must be filled with zeros.
19:16	A[3:0]	Register address. Specifies the register to be accessed during the read or write operation.
15:0	DI[15:0]	Data cycle bits. If a write command, the data cycle bits are the values to be written to the register with address A[3:0]. If a read command, the data cycle bits are don’t care values.

A read operation is initiated by issuing a read command access cycle. After the read command, a second access cycle must be issued to get the requested data, as shown in Table 3. Data are clocked out on SDO pin either on the falling edge or rising edge of SCLK according to the FSDO bit in the CONFIG register.

Table 3. SDO Output Access Cycle

BIT	FIELD	DESCRIPTION
23	RW	Echo RW from previous access cycle.
22:20	Reserved	Echo bits 22:20 from previous access cycle (all zeros).
19:16	A[3:0]	Echo address from previous access cycle.
15:0	DO[15:0]	Readback data requested on previous access cycle.

8.4.2 Daisy-Chain Operation

For systems that contain more than one DACx0508 devices, the SDO pin can be used to daisy-chain them together. Daisy-chain operation is useful in reducing the number of serial interface lines.

The first falling edge on the $\overline{CS}$ pin starts the operation cycle. If more than 24 SCLK pulses are applied while the $\overline{CS}$ pin is kept low, the data ripples out of the shift register and is clocked out on the SDO pin either on the falling edge or rising edge of SCLK according to the FSDO bit. By connecting the SDO output of the first device to the SDI input of the next device in the chain, a multiple-device interface is constructed. Each device in the system requires 24 clock pulses. As a result the total number of clock cycles must be equal to 24 × N, where N is the total number of DACx0508 devices in the daisy chain. When the serial transfer to all devices is complete the $\overline{CS}$ signal is taken high. This action transfers the data from the serial peripheral interface (SPI) shift registers to the internal registers of each device in the daisy chain and prevents any further data from being clocked into the input shift register.

Copyright © 2017, Texas Instruments Incorporated

Figure 64. Daisy-Chain Layout

8.4.3 Frame Error Checking

If the DACx0508 is used in a noisy environment, error checking can be used to check the integrity of SPI data communication between the device and the host processor. This feature can be enabled by setting the CRC-EN bit in the CONFIG register.

The error checking scheme is based on the CRC-8-ATM (HEC) polynomial $x^8 + x^2 + x + 1$ (that is, 100000111). When error checking is enabled, the serial interface access cycle width is 32 bits. The normal 24-bit SPI data is appended with an 8-bit CRC polynomial by the host processor before feeding it to the device, as shown in Table 4. In all serial interface readback operations the CRC polynomial is output on the SDO pin as part of the 32-bit cycle.

Table 4. Error Checking Serial Interface Access Cycle

BIT	FIELD	DESCRIPTION
31	RW	Identifies the communication as a read or write command to the addressed register. R/W = 0 sets a write operation. R/W = 1 sets a read operation.
30	CRC-ERROR	Reserved bit. Set to zero.
29:28	Reserved	Reserved bits. Must be filled with zeros.
27:24	A[3:0]	Register address. Specifies the register to be accessed during the read or write operation.
23:8	DI[15:0]	Data cycle bits. If a write command, the data cycle bits are the values to be written to the register with address A[3:0]. If a read command, the data cycle bits are don't care values.
7:0	CRC	8-bit CRC polynomial.

The DACx0508 decodes the 32-bit access cycle to compute the CRC remainder on $\overline{\text{CS}}$ rising edges. If no error exists, the CRC remainder is zero and data are accepted by the device.

A write operation failing the CRC check causes the data to be ignored by the device. After the write command, a second access cycle can be issued to determine the error checking result (CRC-ERROR bit) on the SDO pin, as shown in Table 5. Additionally, by setting ALM-EN = 1 and ALM-SEL = 0 in the CONFIG register, the SDO/$\overline{\text{ALARM}}$ pin is configured as a CRC alarm pin.

Table 5. Write Operation Error Checking Cycle

BIT	FIELD	DESCRIPTION
31	RW	Echo RW from previous access cycle (RW = 0).
30	CRC-ERROR	Returns a 1 when a CRC error is detected, 0 otherwise.
29:28	Reserved	Echo bits 29:28 from previous access cycle (all zeros).
27:24	A[3:0]	Echo address from previous access cycle.
23:8	DO[15:0]	Echo data from previous access cycle.
7:0	CRC	Calculated CRC value of bits 31:8.

A read operation must be followed by a second access cycle to get the requested data on the SDO pin. The error check result (CRC-ERROR bit) from the read command is output on the SDO pin, as shown in Table 6. As in the case of a write operation failing the CRC check, the SDO/$\overline{\text{ALARM}}$ pin if configured as a CRC alarm pin can be used to indicate a read command CRC failure.

Table 6. Read Operation Error Checking Cycle

BIT	FIELD	DESCRIPTION
31	RW	Echo RW from previous access cycle (RW = 1).
30	CRC-ERROR	Returns a 1 when a CRC error is detected, 0 otherwise.
29:28	Reserved	Echo bits 29:28 from previous access cycle (all zeros).
27:24	A[3:0]	Echo address from previous access cycle.
23:8	DO[15:0]	Readback data requested on previous access cycle.
7:0	CRC	Calculated CRC value of bits 31:8.

8.4.4 Power-Down Mode

The DACx0508 DAC output amplifiers and internal reference can be independently powered down through the CONFIG register. At power-up all output channels and the device internal referece are active by defaul. A DAC output channel in power-down mode is connected internally to GND through a 1 kΩ resistor.

8.5 Programming

The DACx0508 is controlled through a flexible serial interface that is compatible with SPI type interfaces used on many microcontrollers and DSP controllers. Table 7 shows the SPI timing requirements. Figure 65 and Figure 66 show the SPI write and read timing diagrams, respectively.

Table 7. Programming Timing Requirements(1)

		V_{IO} = 1.7 V to 2.7 V			V_{IO} = 2.7 V to 5.5 V			UNIT
		MIN	NOM	MAX	MIN	NOM	MAX

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The high linearity, small package size and wide temperature range make the DACx0508 suitable in applications such as optical networking, wireless infrastructure, industrial automation and data acquisition systems. The device incorporates a 2.5 V internal reference with an internal reference divider circuit that enables full-scale DAC output voltages of 1.25 V, 2.5 V, or 5 V.

9.1.1 Interfacing to Microcontroller

Figure 76 displays a typical serial interface that may be observed when connecting the DACx0508 SPI serial interface to a (master) microcontroller type platform. The setup for the interface is as follows: The microcontroller output SPI CLK drives the SCLK pin of the DACx0508, while the DACx0508 SDI pin is driven by the MOSI pin of the microcontroller. The $\overline{\text{CS}}$ pin of the DACx0508 can be asserted from a general program input/output pin of the microcontroller. When data are to be transmitted to the DACx0508, the $\overline{\text{CS}}$ pin is taken low. The data from the microcontroller is then transmitted to the DACx0508, totaling 24 bits latched into the DACx0508 device through the falling edge of SCLK. $\overline{\text{CS}}$ is then brought high after the completed write. The DACx0508 requires data with the MSB as the first bit received.

Figure 76. Typical Serial Interface

Application Information (continued)

9.1.2 Programmable Current Source Circuit

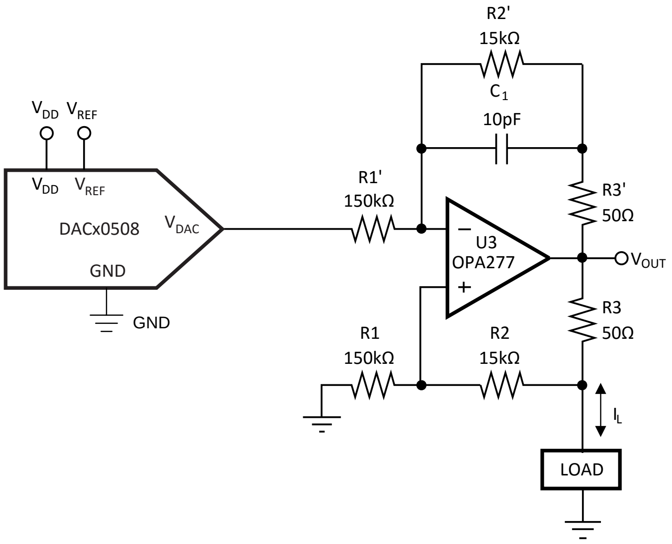
The DACx0508 can be integrated into the circuit in Figure 77 to implement an improved Howland current pump for precise voltage to current conversions. Bidirectional current flow and high voltage compliance are two features of the circuit. With a matched resistor network, the load current of the circuit is shown by Equation 2.

$$I_L = \frac{(R2 + R3) / R1}{R3} \times V_{REF} \times \frac{CODE}{2^n} \tag{2}$$

The value of R3 in Equation 2 can be reduced to increase the output current drive of U3. U3 can drive ±20 mV in both directions with voltage compliance limited up to 15 V by the U3 voltage supply. Elimination of the circuit compensation capacitor C1 in the circuit is not suggested as a result of the change in the output impedance Z_O, according to Equation 3.

$$Z_O = \frac{\left(R1^{'}\right)\left(R3\right)\left(R1 + R2\right)}{R1\left(R2^{'} + R3^{'}\right) - R1^{'}\left(R2 + R3\right)} \tag{3}$$

As shown in Equation 3, with matched resistors, Z_O is infinite and the circuit is optimum for use as a current source. However, if unmatched resistors are used, Z_O is positive or negative with negative output impedance being a potential cause of oscillation. Therefore, by incorporating C1 into the circuit, possible oscillation problems are eliminated. The value of C1 can be determined for critical applications; for most applications, however, a value of several pF is suggested.

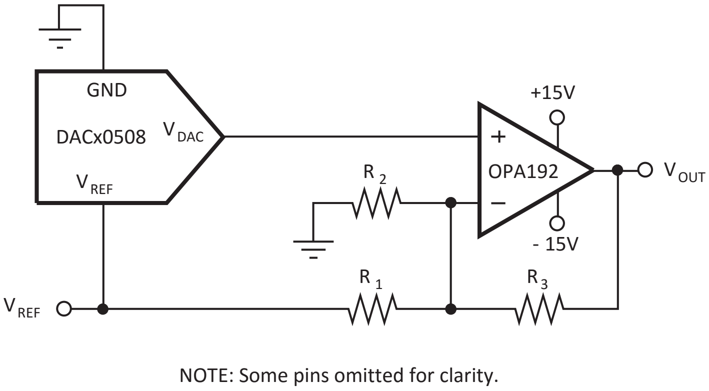


Copyright © 2017, Texas Instruments Incorporated

Figure 77. Programmable Bidirectional Current Source Circuit

9.2 Typical Application

The DACx0508 is designed for single-supply operation; however, a bipolar output is also possible using the circuit shown in Figure 78.



Copyright © 2017, Texas Instruments Incorporated

Figure 78. Bipolar Operation Using the DACx0508

9.2.1 Design Requirements

The circuit shown in Figure 78 gives a bipolar output voltage at V_{OUT}. When GAIN = 1, V_{OUT} can be calculated using Equation 4:

$$V_{OUT}(CODE) = \left[\left(V_{REF} \times \frac{CODE}{2^n}\right)\left(1 + \frac{R_3}{R_2} + \frac{R_3}{R_1}\right) - \left(V_{REF} \times \frac{R_3}{R_1}\right)\right] \quad (4)$$

Where:

- $V_{OUT}(CODE)$ = output voltage versus code
- CODE = 0 to $2^n – 1$. This is the digital code loaded to the DAC
- V_{REF} = reference voltage applied to the DACx0508
- n = resolution in bits. Either 12 (DAC60508), 14 (DAC70508) or 16 (DAC80508)

Table 18. Design Parameters

PARAMETER	VALUE
V_{OUT}	±10 V
V_{REF}	2.5 V
n	12

9.2.2 Detailed Design Procedure

The bipolar output span can be calculated through Equation 4 by defining a few parameters, the first being the value for the reference voltage. Once a reference voltage is chosen, the gain resistors can be set accordingly by determining the desired V_{OUT} at code 0 and code 2^n. For a V_{REF} of 2.5 V and a desired output voltage range of ±10 V the calculation is as follows.

CODE = 0:

$$V_{OUT}(0) = -\left(V_{REF} \times \frac{R_3}{R_1}\right) = -\left(2.5V \times \frac{R_3}{R_1}\right) \quad (5)$$

Setting the equation to minimum output span, $V_{OUT}(0) = –10$ V, will reduce the equation to: $R_3/R_1 = 4$:

CODE = 4096:

Setting the equation to maximum output scan, $V_{OUT}(4096) = 10$ V, and $R_3/R_1 = 4$ will reduce the equation to: $R_3/R_2 = 3$

Copyright © 2017–2018, Texas Instruments Incorporated

It is important to note that the maximum code of a 12-bit DAC is 4095; code 4096 was used to simplify the equation above. For practical use, the true output span will encompass a range of –10 V to (10 V – 1 LSB), which in this case is –10 V to 9.995 V.

9.2.3 Application Curve

The ±10 V output span with a reference voltage of 2.5 V can be achieved by using values of 30 kΩ, 10 kΩ, and 7.5 kΩ for R3, R2, and R1 respectively. A curve to illustrate this output span is shown in Figure 79. Note: 1% tolerance resistors were used in evaluating bipolar operation.

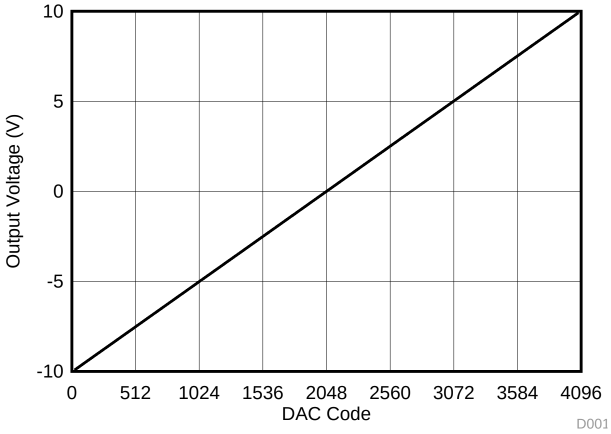


Figure 79. Bipolar Operation

10 Power Supply Recommendations

The DACx0508 operates within the specified V_{DD} supply range of 2.7 V to 5.5 V and V_{IO} supply range of 1.7 V to 5.5 V. The DACx0508 does not require specific supply sequencing.

The V_{DD} supply must be well-regulated and low-noise. Switching power supplies and dc/dc converters often have high frequency glitches or spikes riding on the output voltage. In addition, digital components can create similar high frequency spikes. This noise can easily couple into the DAC output voltage through various paths between the power connections and analog output. In order to further minimize noise from the power supply, include a 1-μF to 10-μF capacitor and 0.1-μF bypass capacitor. The current consumption on the V_{DD} pin, the short-circuit current limit, and the load current for the device is listed in the *Electrical Characteristics*. The power supply must meet the aforementioned current requirements.

11 Layout

11.1 Layout Guidelines

A precision analog component requires careful layout, the list below provides some insight into good layout practices.

- Bypass all power supply pins to ground with a low ESR ceramic bypass capacitor. The typical recommended bypass capacitance is 0.1- to 0.22-µF ceramic with a X7R or NP0 dielectric.
- Place power supplies and REF bypass capacitors close to the pins to minimize inductance and optimize performance.
- Use a high-quality ceramic type NP0 or X7R for its optimal performance across temperature, and very low dissipation factor.
- The digital and analog sections must have proper placement with respect to the digital pins and analog pins of the DACx0508 device. The separation of analog and digital blocks minimizes coupling into neighboring blocks, as well as interaction between analog and digital return currents.

[1] The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

[2] **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

[3] MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

[4] There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

[5] Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

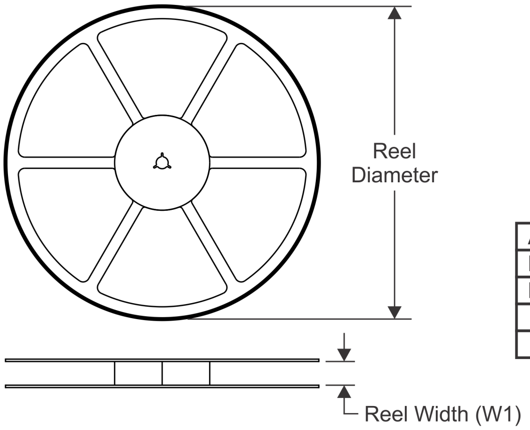
[6] Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

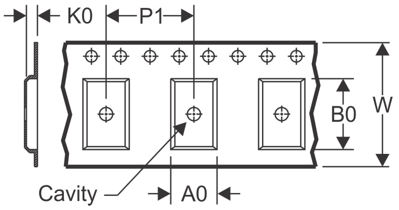
In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

REEL DIMENSIONS



TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

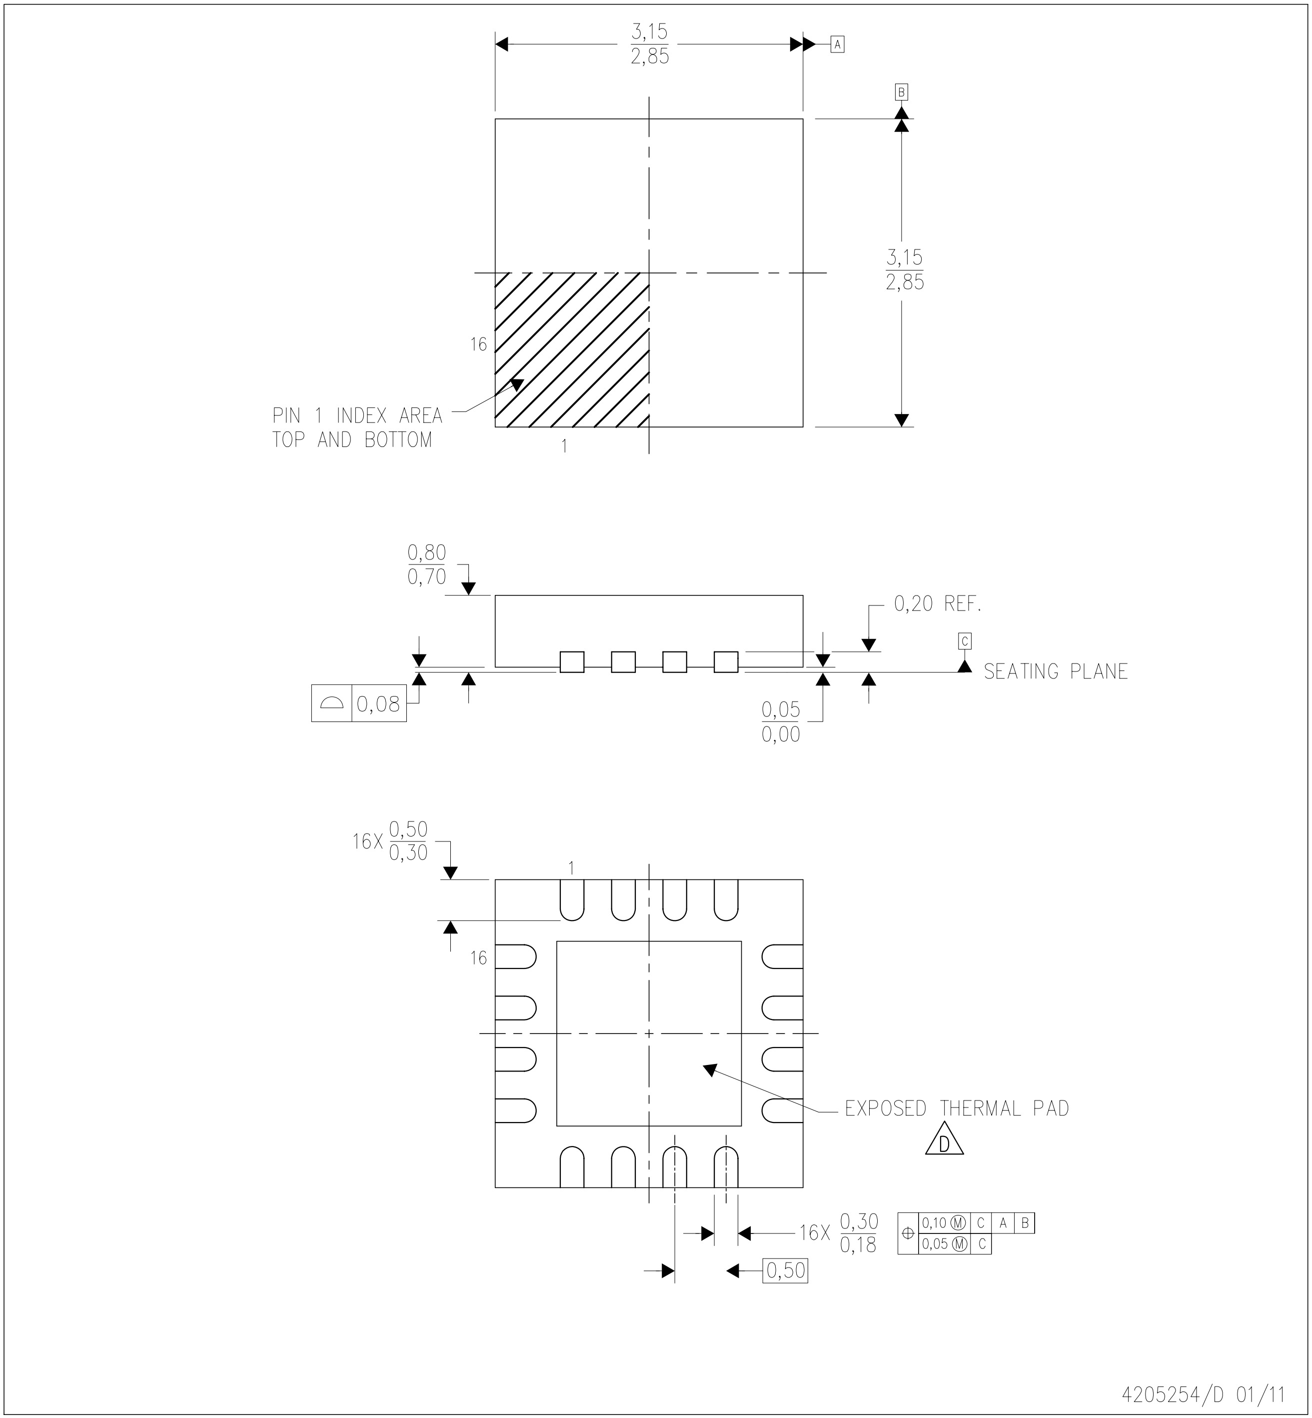
5. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.

RTE (S-PWQFN-N16) PLASTIC QUAD FLATPACK NO-LEAD



NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
- B. This drawing is subject to change without notice.
- C. Quad Flatpack, No-leads (QFN) package configuration.
- D. The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
- E. Falls within JEDEC MO-220.

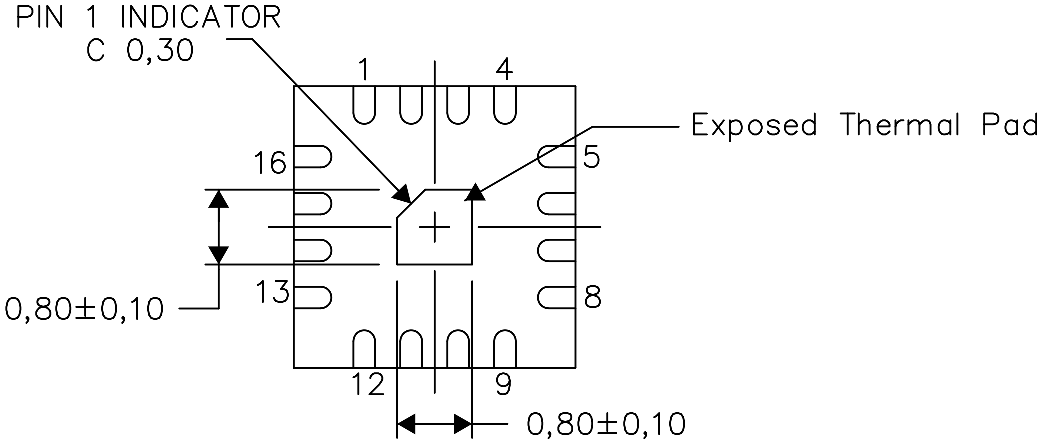
RTE (S–PWQFN–N16) PLASTIC QUAD FLATPACK NO–LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No–Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.



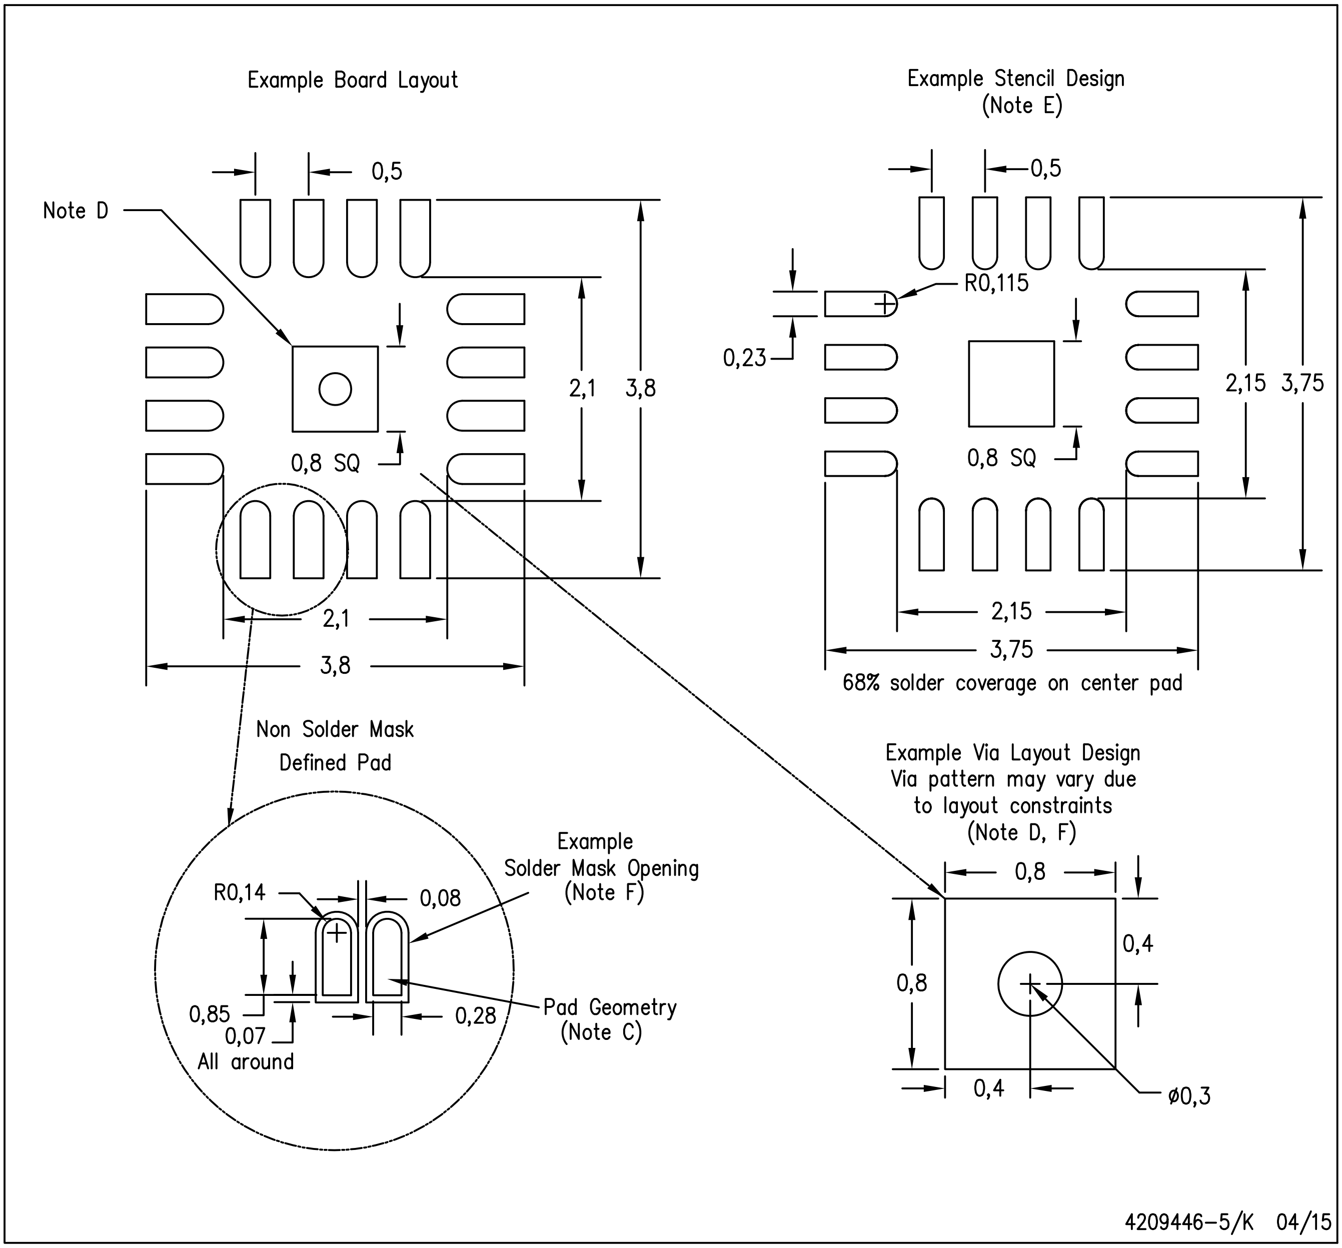
Bottom View

Exposed Thermal Pad Dimensions

4206446–5/U 08/15

NOTE: A. All linear dimensions are in millimeters

RTE (S-PWQFN-N16) PLASTIC QUAD FLATPACK NO-LEAD



NOTES:
- A. All linear dimensions are in millimeters.
- B. This drawing is subject to change without notice.
- C. Publication IPC-7351 is recommended for alternate designs.
- D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <http://www.ti.com>.
- E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
- F. Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.
