

Application Note

MSPM0 Design Flow Guide

Eason Zhou, Zoey Wei, Helic Chi, and Janz Bai

ABSTRACT

The application note details steps on how to develop MSPM0 MCUs. Related materials and instructions are provided.

Table of Contents

1 Overview	4

1 Overview

The document provides steps for projects to develop an MSPM0 MCU. A list of related documents and step-by-step instructions are provided. For common questions that developers can encounter, see [Section 6](#).

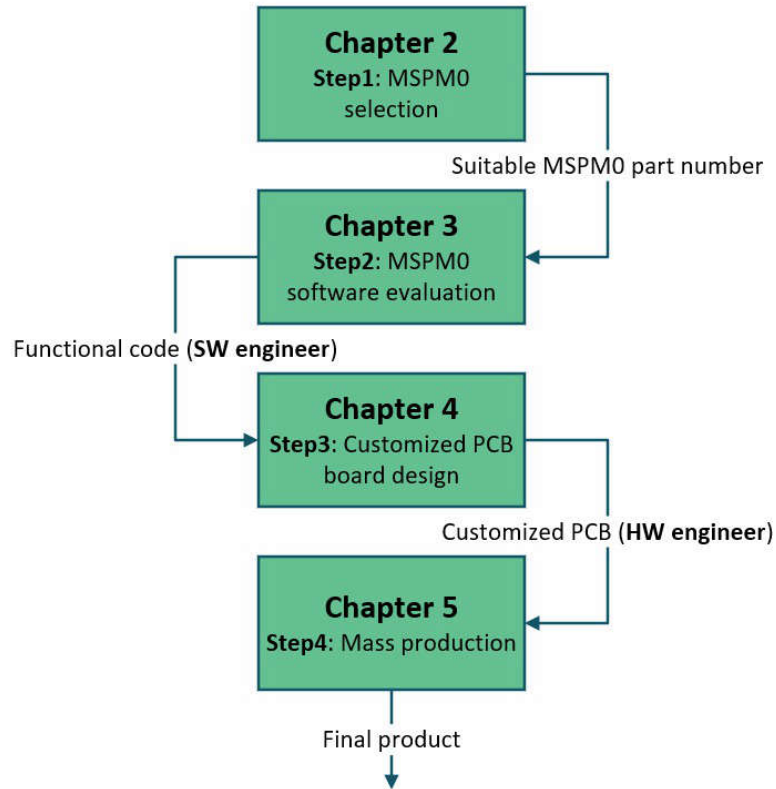

Figure 1-1. MSPM0 Design Flow

2 Step 1: MSPM0 Selection

This step discusses how to find an MSPM0 orderable number.

Visit the [Arm Cortex-M0+ MCUs product page](#) to view the list of MSPM0 devices. After navigating to this page, use the filters on the left to perform an initial screening based on MCU peripheral requirements, or directly navigate to the device page using the search box on the left side of the page.

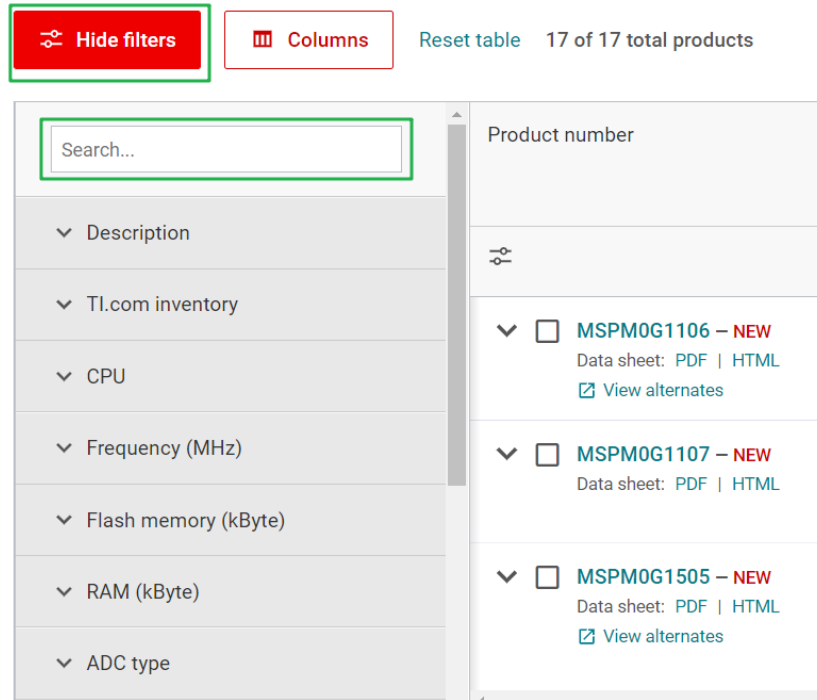

Figure 2-1. MSPM0 Device List

After navigating to the device page, more specification or functional details for a specific product are available. The key documents are the data sheet, technical reference manual (TRM), and errata. The device-specific data sheet introduces the parameters and functional data information for the MSPM0. The device-specific TRM introduces the application method and characteristics of a MSPM0 device. The device-specific errata shows descriptions of MSPM0 related series or versions.

Figure 2-2. MSPM0 Important Document List

Figure 2-3 shows the *Device Comparison* table in a device-specific data sheet. A user can compare different part numbers using this table.

5 Device Comparison

Table 5-1. Device Comparison

DEVICE NAME ⁽¹⁾ ⁽²⁾	FLASH / SRAM (KB)	QUAL ⁽³⁾	ADC CH.	COMP	OPA	GPAMP	UART/I2C/SPI	TIMG	GPIOs	5-V TOL. IO	PACKAGE [BODY SIZE] ⁽⁴⁾

3 Step 2: MSPM0 Evaluation

This step shows how to set up a hardware and software evaluation environment for MSPM0. For step-by-step instructions based on CCS and LaunchPad, see [Section A.1](#).

[Table 3-1](#) lists a summary of all the required components in an MSPM0 development chain. Devices are described individually in the following sections.

Table 3-1. MSPM0 Development Chain

IDE	SysConfig (Code Generator GUI)	SDK	Debugger	Hardware
CCS with SysConfig integrated	Standalone SysConfig	MSPM0 SDK	Launchpad with XDS110 On-Board	
Keil			XDS110	Customized board
IAR			J-Link	

3.1 Hardware Setup

3.1.1 Debugger Selection

This section summarizes different debuggers that support MSPM0 devices. The XDS110 debuggers are owned by TI, which support more functions, as compared to general debuggers. For more details about XDS110 debuggers, see [Section 5.3](#).

Table 3-2. MSPM0 Debugger Comparison

Features	XDS110 (TMDSEMU110-U)	XDS110 On-Board	J-Link
cJTAG (SBW)	√	√	√
BSL tool	√	√	
Backchannel UART	√	√	
Power supply	1.8 - 3.6V	3.3 - 5V	5V
IDE	CCS, IAR, Keil	CCS, IAR, Keil	CCS, IAR, Keil

3.1.2 LaunchPad Introduction

TI recommends to start MSPM0 development with LaunchPad™. **Figure 3-1** shows an overview of the LaunchPad. The LaunchPad contains the MCU and a XDS110 debugger. A user can use a debugger such as a J-Link to debug the MCU after removing the jumpers.

Figure 3-1. MSPM0G3507 LaunchPad

The following links show orderable LaunchPad devices and related user's guides.

- [LP-MSPM0L1306 landing page](#)
- [LP-MSPM0G3507 landing page](#)
- [LP-MSPM0C1104 landing page](#)

- [MSPM0G3507 LaunchPad Development Kit User's Guide](#)
- [MSPM0C1104 LaunchPad Development Kit User's Guide](#)

A real launchpad setup condition is shown in **Figure 3-1**, which can be debugged and powered with a USB port.

Figure 3-2. Launchpad Setup View

3.2 MSPM0-SDK Setup

The MSPM0-SDK provides the ultimate collection of software, tools, and documentation to accelerate the development of applications for the MSPM0 MCU platform, providing a consistent and cohesive experience with a wide variety of drivers, libraries, and examples under a single software package.

3.2.1 MSPM0-SDK Installation

This section details steps to install MSPM0-SDK. After installation, the default SDK directory path is: `C:\ti\mspm0_sdk_x_xx_xx_xx`.

1. Before downloading, a myTI account is required. Register for a myTI account [here](#).
2. Download the latest MSPM0-SDK from the [product page](#). Click *Download options*, select the operating system, and click the file name to start downloading.

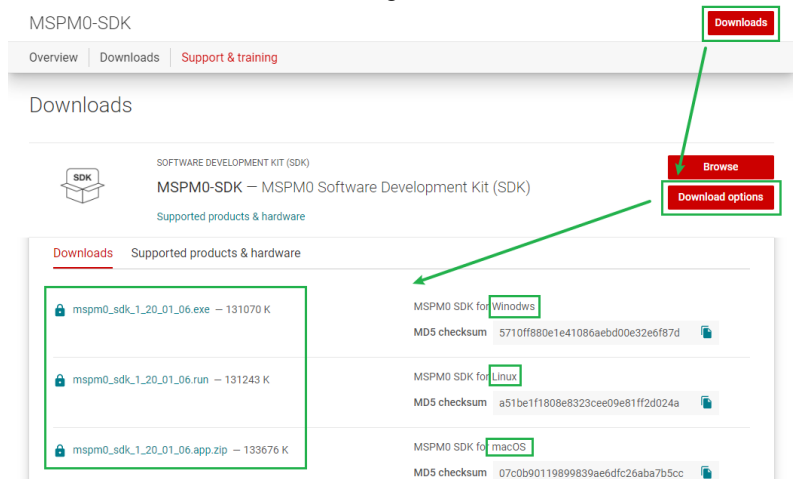

Figure 3-3. MSPM0-SDK Download

3. After downloading, follow the steps in [Figure 3-4](#) to finish installation.

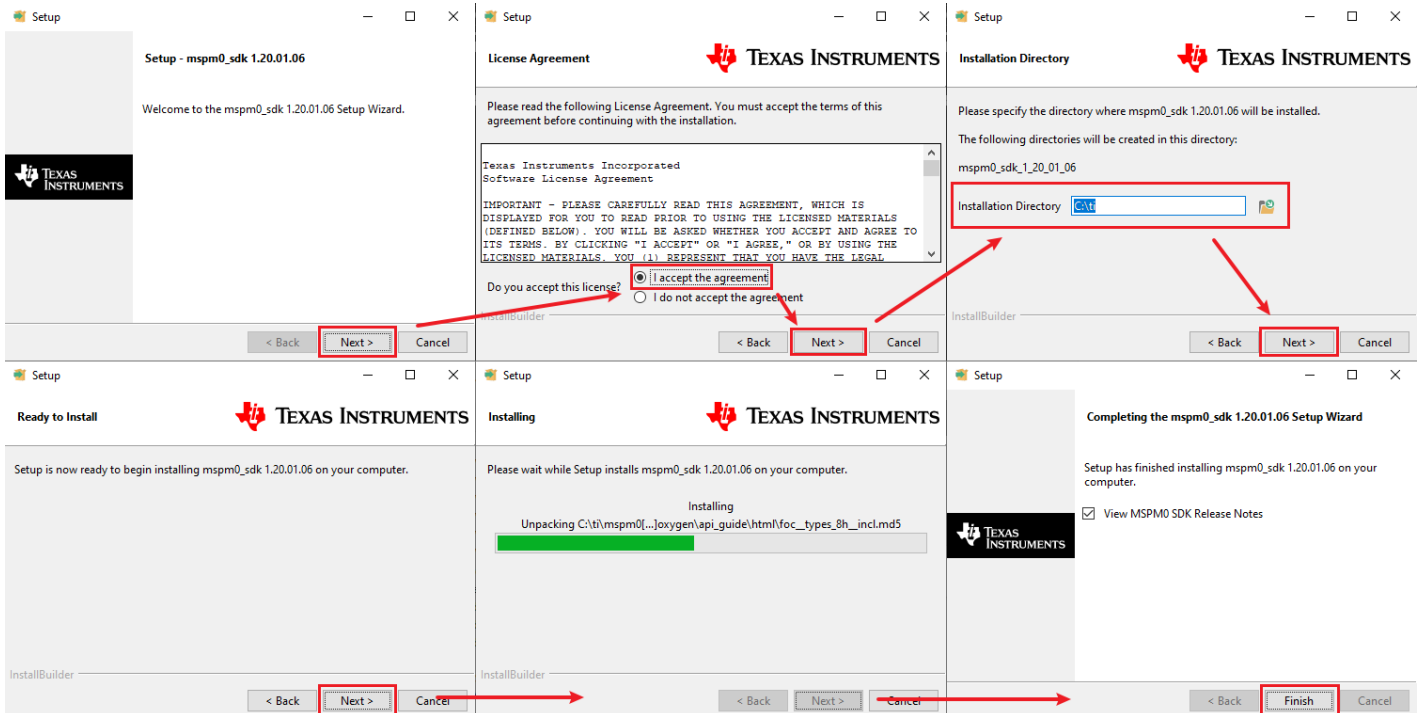

Figure 3-4. MSPM0-SDK Install Step-by-Step

3.2.2 MSPM0-SDK Introduction

There are five folders in the SDK install directory, listed in [Figure 3-5](#). This section provides a brief introduction to all the folders.

- Docs folder: Contains all the documentation for SDK.
- Examples folder: Contains all the examples for reference, which can be used to provide a reference and starting point to accelerate application development. For more details, see the [MSPM0-SDK Example Guide](#).
- Kernel folder: Built files for RTOS and nortos, which is included in the example project and accelerates the speed of the project build.
- Source folder: Contains all the source code for TI and third party libraries.
- Tool folder: Contains all the tools related to SDK, such as sysconfig support files, BSL GUI, and metrology GUI.

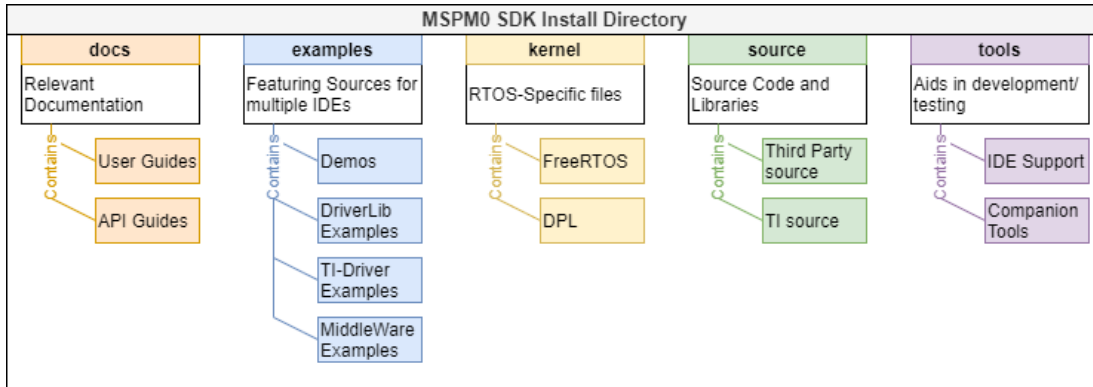

Figure 3-5. MSPM0-SDK Structure

The most important folders are example and document folders. [Figure 3-6](#) shows the related addresses of the folders under the MSPM0-SDK directory.

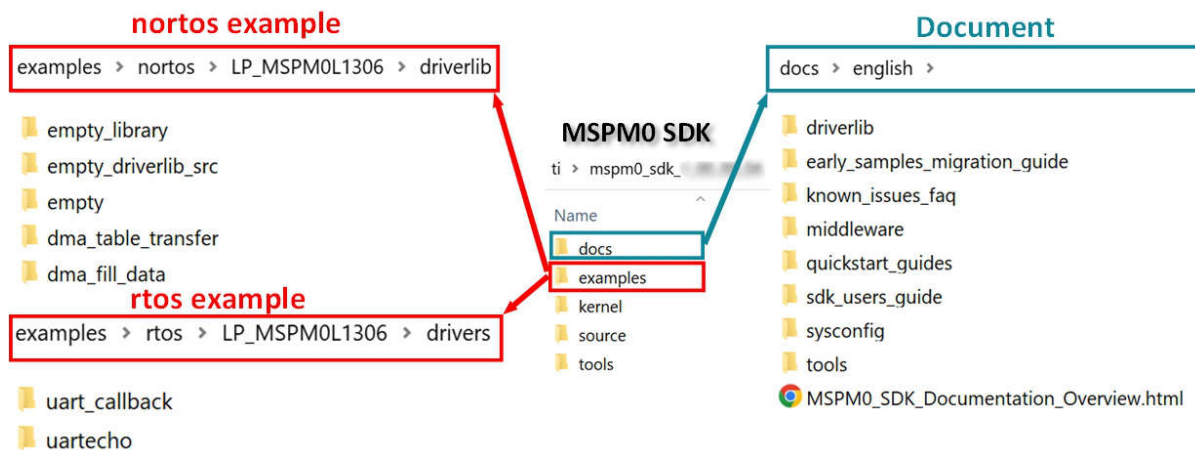

Figure 3-6. MSPM0-SDK Example

3.2.2.1 Documents Folder Introduction

This section lists all the documents in MSPM0-SDK. This is based on version 1_20_01_06.

MSPM0 SDK Documentation:

- [Release Notes](#): Lists all the contents of the MSPM0-SDK and release notes.
- [Quick Start Guides](#): Provides step-by-step instructions to get started quickly using MSPM0 with Code Composer Studio™ (CCS) Theia, CCS, IAR or Keil.
- [MSPM0 SDK User's Guide](#): Homepage of MSPM0-SDK. Provide navigation to MSPM0-SDK example guide and SDK overview.
- [Manifest](#): Lists all the contents in SDK and every installation file path for each component.
- [Early Samples Migration Guide](#): Describes the recommended tool versions that support production samples and provide migration guidelines for applications using DriverLib and SysConfig configuration files.

DriverLib Documentation:

- [DriverLib Guide](#): Provides a software layer to the programmer to facilitate a higher level of programming compared to direct register access.

TI Drivers Documentation:

- [TI Drivers Overview](#): TI Drivers is a collective of peripheral drivers for TI's MSPM0 portfolio. The drivers are centered around a portable application programming interface (API) which enables seamless migration across the MSPM0-SDK portfolio. Unless specifically stated otherwise, TI Drivers are designed to be thread safe and work seamlessly inside of a real-time operating system (RTOS) application.

Middleware Documentation (Libraries and protocol stacks for different applications):

- [Middleware Main Folder](#)
- [Secure Booting and Updating](#)
- [Brushed Motor Control Library](#)
- [DALI Library](#)
- [Diagnostic Library](#)
- [EEPROM Emulation Library](#)
- [Energy Metrology Library](#)
- [GUI Composer Library](#)
- [Hall Sensored Trap Motor Control Library](#)
- [IQMath Library](#)
- [LIN Library](#)
- [Sensorless FOC Motor Control Library](#)
- [SENT Library](#)
- [SMBBus Library](#)
- [Stepper Motor Control Library](#)
- [PMBus Library](#)

Third Party Documentation:

- [CMSIS DSP](#): Texas Instruments supports Arm® Cortex® Microcontroller Software Interface Standard (CMSIS), a standardized hardware abstraction layer for the Cortex-M processor series.
- [IO-Link](#): Digital interfaces such as IO-Link on the sensor and actuator level offer advantages when maintenance and repair is required in addition to providing seamless communication and improved interoperability.
- [Zephyr](#): Texas Instruments has started development to support [Zephyr](#) as a real-time operating option for MSPM0 devices.

MSPM0 Tools Documentation:

- IDEs and Compilers: MSPM0 supports IDEs: Code Compose Studio (CCS), [IAR Embedded Workbench for Arm](#), [Arm Keil MDK](#). For the toolchain, MSPM0 supports both [TI Arm Clang Compiler](#) and [Arm GCC Toolchain](#).
- Code Generation: MSPM0 supports [SysConfig](#).

Debugging and Programmings Tools:

- **XDS-110**: The Texas Instruments XDS110 is a new class of debug probe (emulator) for TI embedded processors.
- **MSP-GANG**: The MSP Gang Programmer (MSP-GANG) is a device programmer that supports MSPM0 and all variants of MSP430 and MSP432.
- **UniFlash**: UniFlash is a standalone tool used to program on-chip flash memory on TI MCUs and on-board flash memory for Sitara processors. To access the quick start guide, click [here](#).
- **BSL Host**: MSPM0 devices are shipped with a highly customizable ROM-based bootloader that supports universal asynchronous receiver/transmitter (UART) and inter-integrated circuit (I2C) communication by default. For more information, see the [MSPM0 Bootloader \(BSL\) Implementation](#).
- **MSPM0 Factory Reset GUI Tool**: The Debug Subsystem Mailbox (DSSM) can be used to perform a device mass erase, perform a factory reset, and send a password to unlock the SWD interface.
- **Elprotronic**: Elprotronic offers multiple hardware and software programming tools supporting MSPM0 in addition to Texas Instruments' MSP430 and MSP432, SimpleLink™ (CC), C2000™, and TIVA™-C MCUs. Elprotronic supports MSPM0 include the MSP-GANG, FlashPro-ARM, and GangPro-ARM.
- **Segger**: [SEGGER J-Link](#) debug probes are the most widely used line of debug probes available today. For more details, see [Using Segger programmers with MSPM0](#).
- **PEmicro**: [PEmicro Multilink and Multilink FX](#) debug probes offer an affordable and compact method for TI MSPM0 development, and allow debugging and programming to be accomplished simply and efficiently.
- **Lauterbach**: MSPM0 is supported by all Arm debug tools. Generally used for Cortex-M controllers, the preferred tool is the [µTrace for Cortex-M](#).

3.2.2.2 Examples Folder Introduction

TI manufactures a LaunchPad for one MSPM0 sub family with a superset MSPM0 on board. The same example code can be reused across this MSPM0 sub family. The nortos example is under the address `mspm0_sdk_x_x_x_x \ examples \ nortos \ LP_MSPM0xxxx` and the RTOS example is under the address `mspm0_sdk_x_x_x_x \ examples \ RTOS \ LP_MSPM0xxxx`. This section shows a brief introduction for some key example types.

- RTOS Folder:
 - Drivers: Examples uses kernel functionality and provide higher-level hardware operation based on TI Drivers. For Driver Porting Layer (DPL), the DPL abstracts the drivers, allowing for migration between different RTOS kernels or No-RTOS. For POSIX layer, the layer abstracts RTOS functionality, allowing for migration to new kernels.
- Nortos Folder:
 - DriverLib: Simple modular examples showing MSPM0 functionality, consisting of low-level drivers with the highest optimization.
 - Middleware: Designs for different applications, with libraries and protocol stacks, including automotive, appliances, building automation, and so on. For a list of supported middleware, see [MSPM0-SDK Document Overview](#).
 - Demos: Integrated ready-to-use demos, such as driver code examples to work with TI analog devices.

For reference, examples under *Drivers* and *DriverLib* supports all the platforms listed in [Table 3-3](#). Examples under other folders at least support the CCS platform.

Table 3-3. MSPM0 Example Coverage

Supported by SDK	Platform 1		Platform 2	Platform 3
IDE	CCS		Keil	IAR
Compilers	TI Arm-Clang	GNU Arm (GCC)	Arm and Keil Compiler	IAR Arm compiler
RTOS	FreeRTOS			
Code examples	DriverLib and TI Drivers			

In the RTOS example level, the most important folder is the *Drivers* folder that demos the peripheral control based on TI Drivers.

In the nortos example level, the most important folder is the *DriverLib* folder, which contains the peripheral example code based on DriverLib. In nortos examples, there are four empty examples for users to build projects. The differences are listed in [Table 3-4](#).

Table 3-4. Empty Project Description

Example	Type	Language	Use SysConfig	Library Files in Project
empty	Project	C	Yes	No
empty_cpp	Project	C++	Yes	No
empty_library	Static library (.lib file in <i>Debug</i> folder after debugging)	C	No	No
empty_driverlib_src (Suggested)	Project	C	Yes	Yes

For a MSPM0 peripheral quick start, please see [MSPM0 Academy](#) as well, which delivers training modules for various topics in the MSP MCU portfolio.

3.3 SysConfig Setup

SysConfig is a collection of graphical utilities for configuring pins, peripherals, and other components. SysConfig helps manage, expose, and resolve conflicts visually so that a user has more time to create differentiated applications. The output of the tool includes the C header and code files that can be used with MSPM0-SDK examples or used to configure custom software.

3.3.1 SysConfig Installation

If a user selects CCS as the IDE platform, this section can be ignored, as SysConfig is already integrated.

If a user selects Keil or IAR as the IDE platform, download the standalone [SysConfig configuration tool](#) and follow the steps to finish the installation, as shown in [Figure 3-7](#).

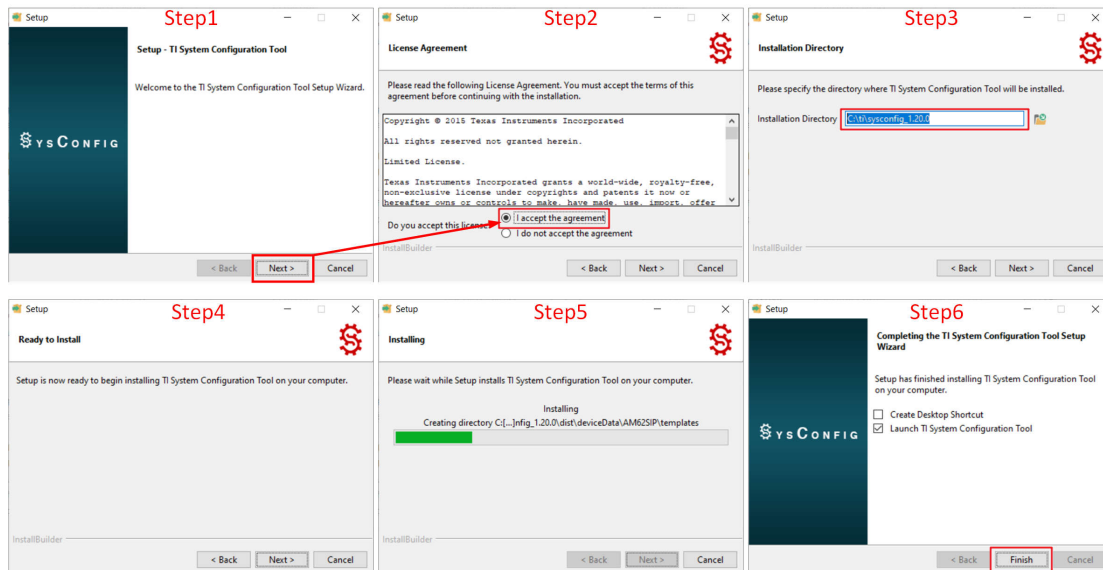

Figure 3-7. SysConfig Install

3.3.2 SysConfig Introduction

This section is a simple introduction on how to use SysConfig. Additional sections further introduce how to use SysConfig with IDE in [Section 3.4](#).

- Add the required peripherals in *Peripheral Usage*.
- Set the parameters in *Peripheral* setting, paired with the device-specific technical reference manual.
- After debugging, the peripheral can generate C code directly.

Figure 3-8. MSPM0 SysConfig

The next section introduces the components in SysConfig, which is abstracted from [Using SysConfig with MSPM0](#).

3.3.2.1 Basic Concept

This section introduces SysConfig function blocks and basic operation.

As shown in [Figure 3-9](#), the basic view is shown after SysConfig is opened. SysConfig has two function blocks: the peripheral usage block, which is used to show the added peripherals and the peripheral setting menu entrance. Second is the peripheral setting, which is used to configure the MCU peripherals.

After clicking the buttons on the right side of the screen, the user can open more windows. Generated files are shown after the project build. The user can click the files individually to know the changes after doing new settings on SysConfig. The MCU view is used to view the pin assignment and pin resources, which is also an entrance for MSPM0 migration.

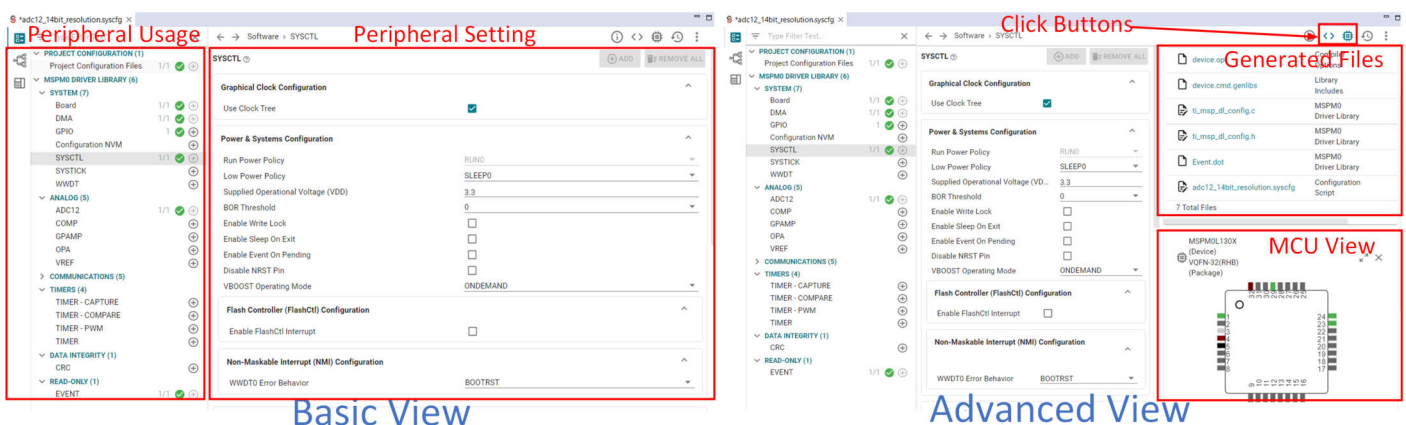

Figure 3-9. SysConfig View

The basic operations of SysConfig, includes adding peripherals, removing peripherals and referring the peripheral or function descriptions. As SysConfig is a low level MSPM0 peripheral setting GUI, see the technical reference manual or the peripheral examples to obtain a better understanding.

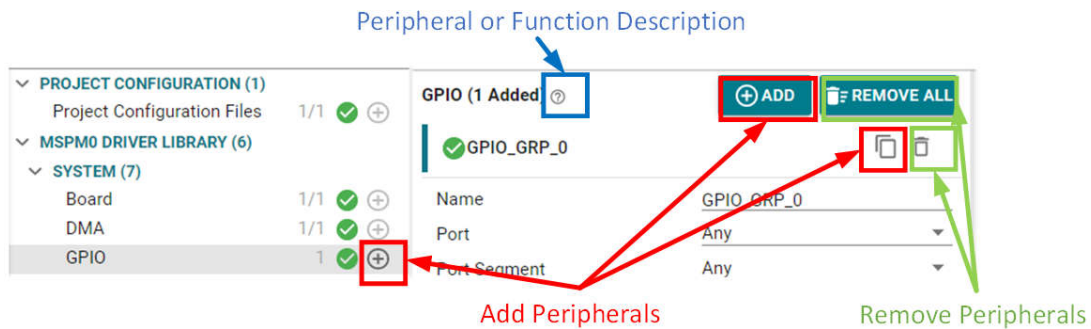

Figure 3-10. Basic Operations

3.3.2.2 Project Configuration View

Here is the project configuration. The configuration influences the total MCU project setting. This section is an introduction to some important features.

- **File Generation:** After you enable all the selection box, the project related files are auto generated by SysConfig. We suggest you to keep them under selection.
- **Include Libraries:** This shows all the libraries included in the SDK. After the selection box is enabled, the related library is included into the project automatically.
- **Select Device:** As the SDK examples is for the LP, after the MCU is migrated, this setting can be changed.

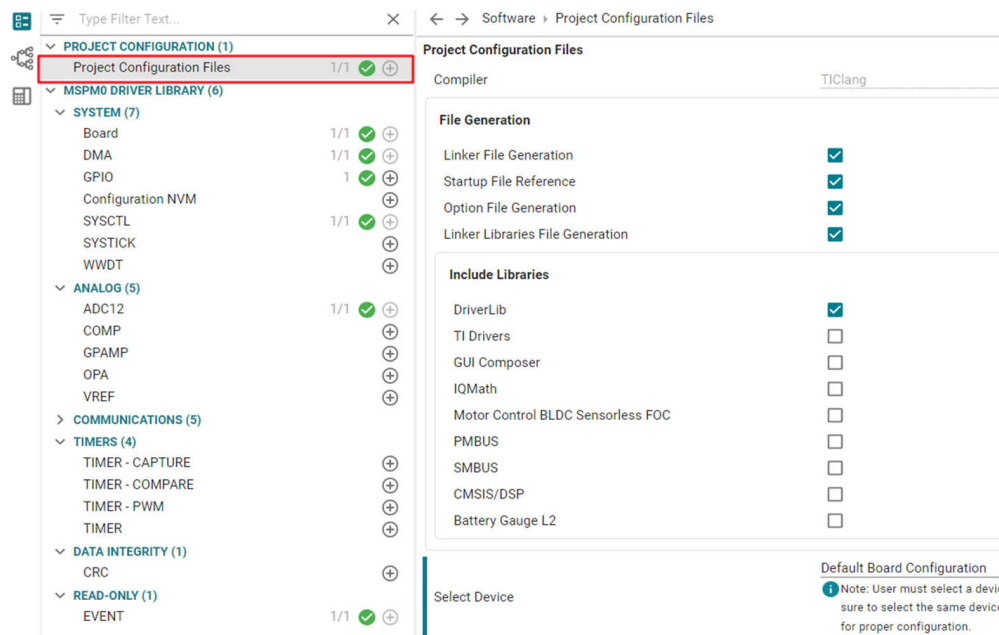

Figure 3-11. Project Configuration

3.3.2.3 Board View

Board view is used to configure the total MCU configuration.

- **Debug Configuration:** For some MSPM0s, the configuration reuses the debug port as peripheral functions. This is the SWD disabled entrance.
- **Global Pin Configuration:**
 - Enable Global Fast-Wake: This reduces the wake-up time sourced from any GPIO port.
 - Generate Peripherals and Pin Assignments File: As shown in [Figure 3-12](#), after enabling, a peripherals and pin assignments file will be generated in the *Debug* folder.

Figure 3-12. Board View

3.3.2.4 NONMAIN View

The NVM (NONMAIN) is used to configure the MSPM0 protected area related to boot configuration, security, and bootloader. With the incorrect program in NONMAIN, MSPM0 breaks. That is why the configuration risks must be accepted before performing configurations. As this function is for high level users, for details, please refer to [MSPM0 NONMAIN FLASH Operation Guide](#).

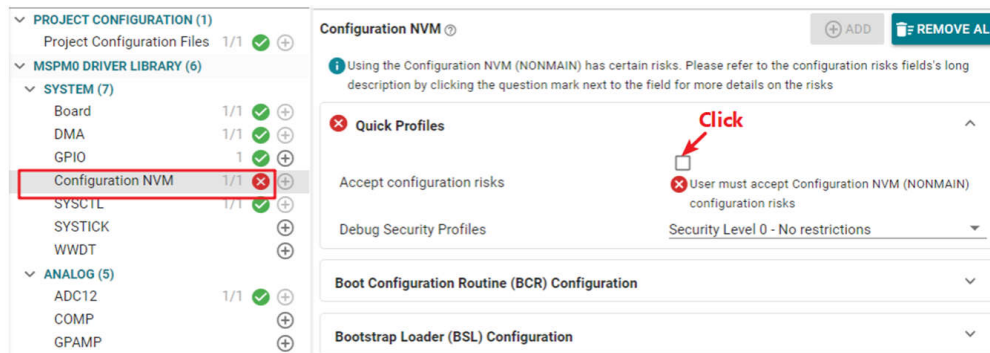

Figure 3-13. NONMAIN View

3.3.2.5 SYSCTL View

SYSCTL is used to configure MCU power, clock, and reset modules. The basic view is menu view. This section introduces the main configurations.

- Power and Systems Configuration:
 - Low power policy: Sets the low-power level for MSPM0.
 - Disable NRST pin: For some MSPM0 devices, the NRST pin can be reused as peripheral functions. This is the NRST pin disabled entrance.

The second view is clock tree view. The clock tree feature allows the user to configure the clocking of a device graphically rather than using SYSCTL menus, which can be found by clicking the signal icon near the top left corner of SysConfig. At the bottom left of the clock tree view, a user can locate all of the used clocks. For a detailed configuration on every clock source, click the icons as shown in Figure 3-14.

Figure 3-14. SYSCTL View

3.3.2.6 Peripherals Setup

This section introduces peripheral settings, as shown in [Figure 3-15](#). Open the software module description by selecting the module before adding the description. The description includes an overview of the functionality of the module. For more information, see the device data sheet or technical reference manual.

A peripheral configuration is a combination of these configurations:

- Basic configuration: Basic peripheral configuration
- Advanced configuration: Advanced peripheral configuration
- Interrupts configuration: Enable or disable MCU interrupt
- Event configuration: Peripheral to peripheral trigger configuration
- Pin configuration: Enables pullup or pulldown resistors
- PinMux: Selects the pin input or output for the selected functions

Figure 3-15. Peripherals View

3.4 IDE Quick Start

The MSPM0 series supports three IDEs to develop. CCS is recommended as a preferred option, as it is TI's IDE which is compatible with MSPM0. [Table 3-5](#) lists and compares the three different types of IDEs.

Table 3-5. MSPM0 Supported IDEs Overview

IDEs	CCS	IAR	Keil
License	Free	Paid	Paid
Compiler	TI Arm Clang GCC	IAR C/C++ Compiler™ for Arm	Arm Compiler Version 6
Disk size	3.44G(ccs1220)	6.33G(Arm 8.50.4)	2.5G (µVision V5.37.0)
XDS110	Supported	Supported	Supported
J-Link	Supported	Supported	Supported
EnergyTrace	Supported	No	No
MISRA-C	No	Supported	No
Security	No	Supported	No
ULINKplus	No	No	Supported
Function safety	No	Supported	Supported

The following links provide the related guides for different IDEs. All the content in this part is abstracted from these guides.

- [Quick Start Guides](#)

3.4.1 CCS Quick Start

3.4.1.1 CCS Installation

This section details steps and tips for CCS installation. Remember to save CCS at the address and the default installation place that is suggested.

1. Download [CCS](#) (12.2 version or above), start installation, and keep pressing *Next*.

Figure 3-16. CCS Installation

2. Select MSPM0 support component.

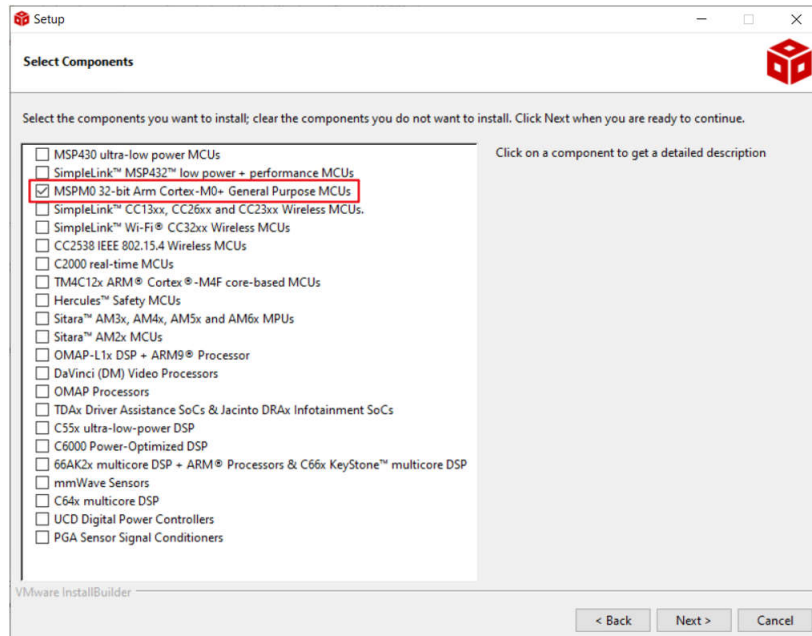

Figure 3-17. MSPM0 Support Selection

3. Select J-link if required.

Figure 3-18. J-Link Selection

3.4.1.2 Environment Setup

If the user installs CCS and SDK at the default address folder: (C:\ti\), the related SDK and SysConfig will be loaded automatically when an example is imported. The environment setup chapter can be skipped.

3.4.1.2.1 SDK Support Setup

For SDK introduction and installation, see [Section 3.2.2](#). If CCS and SDK are installed at the customized address, use the following steps so that CCS loads SDK successfully.

1. Select *Window* → *Preferences*.
2. As the SDK 2.1.0.03 is installed in the C:\ drive, add C:\ as the product discovery path.
3. Refresh the *Discovered products* window. The SDK 2.1.0.03 is recognized automatically.
4. Click the *Apply and Close* button. The new imported project loads the SDK automatically.

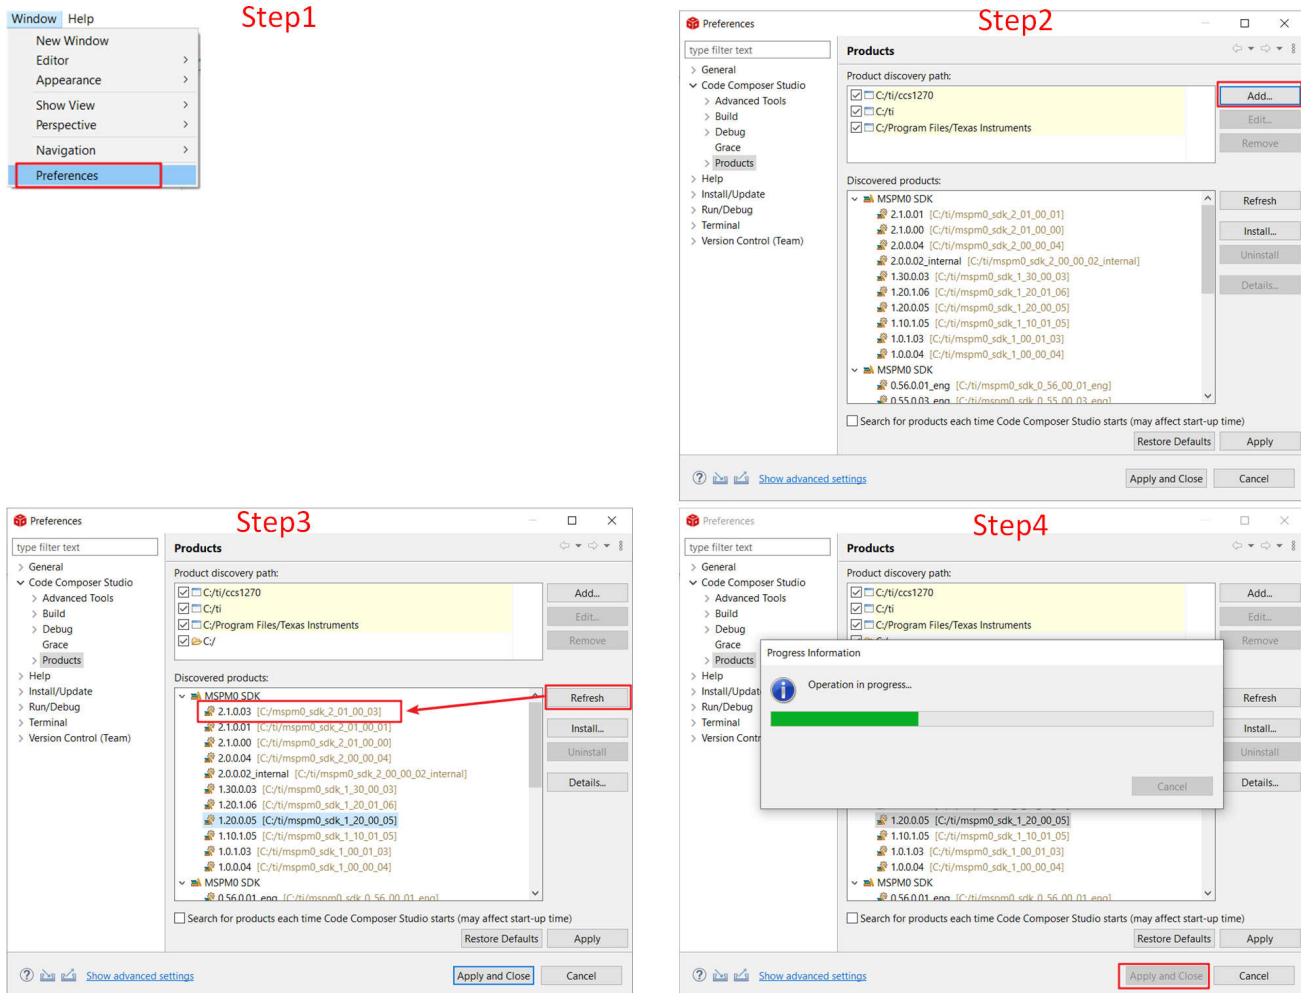

Figure 3-19. Load SDK Product

After an example is imported, follow the steps to select the desired version of the SDK. The steps can also be used when the user wants to migrate an example from an older version of SDK to a newer version.

Step 2: MSPM0 Evaluation

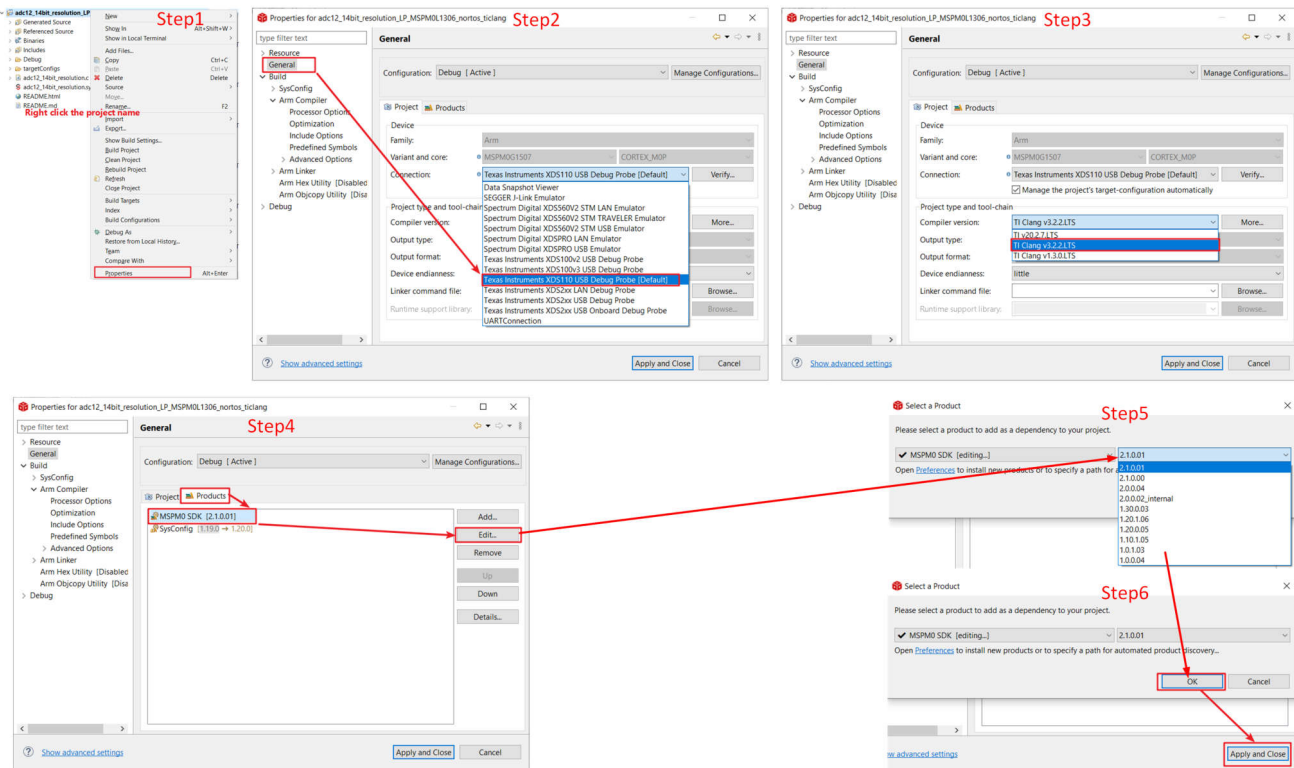

Figure 3-20. Select or Change SDK Version

3.4.1.2.2 SysConfig Support Setup

As the SysConfig is installed with CCS, no further work is required. However, there can be some version compatibility problems on old CCS projects or when a new CCS version is installed that the opened SysConfig reports errors. See SDK installation steps in [Section 3.4.1.2.1](#) to migrate to a different SysConfig version. For SysConfig introduction and installation, see [Section 3.3](#).

3.4.1.3 Import a SDK Example

Open CCS. The workspace is the address to copy an imported project to.

Figure 3-21. Select CCS Workspace

Import an example with the TI-Clang compiler from the installed SDK.

Figure 3-22. Import Project

Here is the view of the imported project. The most important files are in red. This section shows a brief introduction.

- Sysconfig generated code: Click the *Build* button, the SysConfig generates the code under the *Debug\syscfg* folder.
- .map file: In the *Debug* folder, refer to the .map file to find out more about the memory usage condition.
- Main function .c file: Includes the main function in the file.
- .cmd file: Define the MCU memory allocation. In the latest CCS, the user can select to allow SysConfig to generate the allocation automatically.
- SysConfig: GUI tool to generate the peripheral setting code.

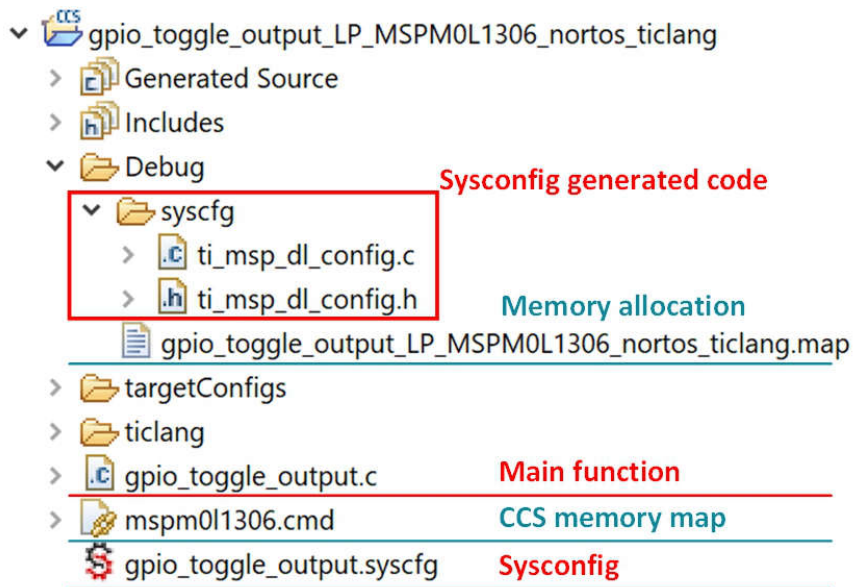

Figure 3-23. CCS Project Overview

3.4.1.4 Example Download and Debug

The default debugger selection is XDS110. To select J-Link, right click the *Project->Properties* and follow the steps to select J-Link.

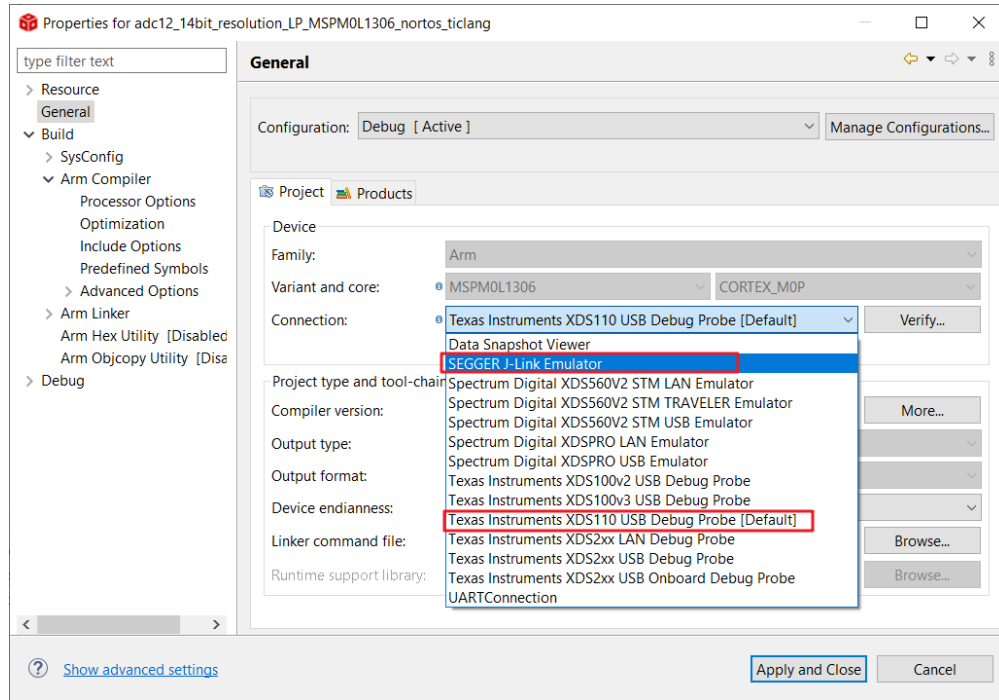

Figure 3-24. Change Debugger Selection

Start debug by click the *Build* button at the top. After that, the window automatically moves from the CCS edit view to CCS debug view. After the MCU enters debug mode, click the *Run* button to enable the code running.

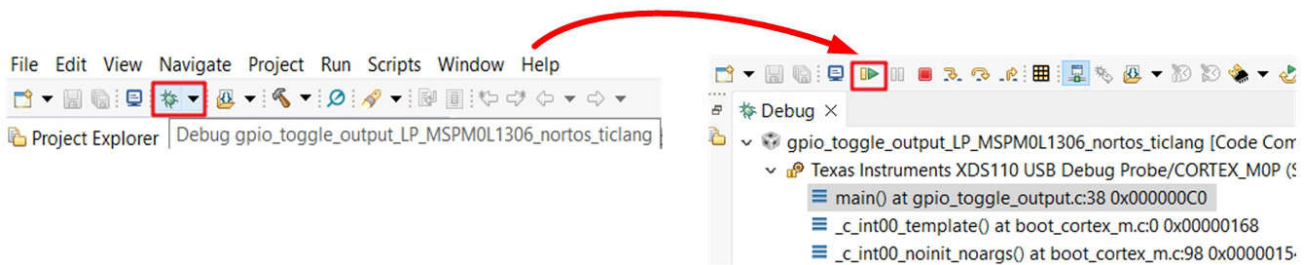

Figure 3-25. Debug Code

This section is a quick introduction to CCS functions. The commonly used functions and meanings are shown in Figure 3-26.

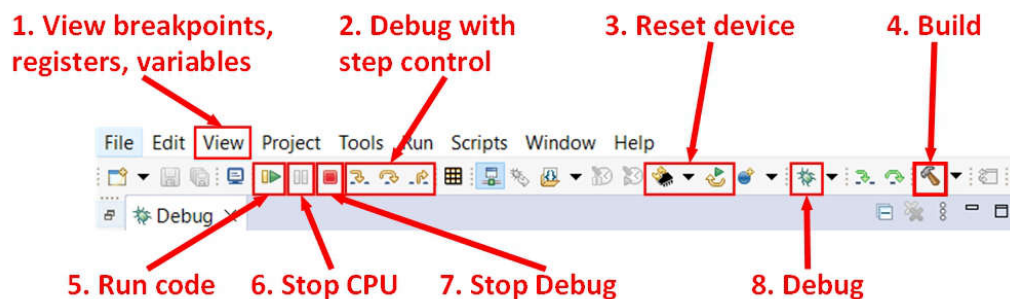

Figure 3-26. Commonly Used Debug Functions

3.4.1.5 Migrating Between MSPM0 Derivatives

Project migration in this scope means updating relevant project configuration files and settings that are specific to the derivative, including linker files, startup files, and included libraries. In order to facilitate project migration, SysConfig generates project configuration files by default, which can be controlled through the project configuration module.

Here are the migration steps based on CCS:

1. In SysConfig, enable the device View and click on *SWITCH*.
2. Select the New Values for the *Device*, *Package*, and *CCS Launch Device* to migrate the project configuration to a new device, and then click *CONFIRM*.
3. After confirming the new device values, SysConfig highlights an error on the project configuration module. The user must select the new device in the *Select Device* options. Make sure the device selection matches what was selected for *CCS Launch Device* in the previous step.
4. Note that SysConfig highlights any conflicts with the migration, such as unavailable pins and peripherals. Fix any conflicts as needed, and save all the changes to the SysConfig configuration script. Migration is now complete and the user can build a project for the new target device.

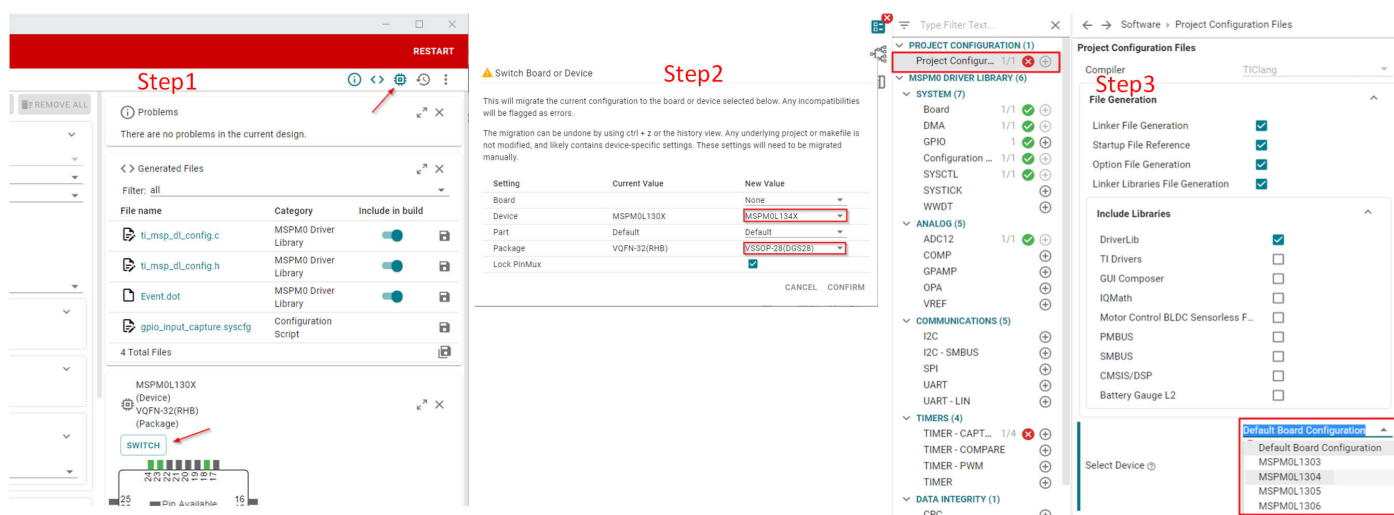

Figure 3-27. Migrating Between MSPM0 Derivatives

3.4.1.6 Generate Hex Files

CCS includes utilities which can be used to generate output objects in multiple formats for use with programming tools. The following steps explain how to enable the hex files using the hex utility which is integrated into CCS.

1. Right-click on a project and select *Properties*. Select *Build* → *Arm Hex Utility* and select *Enable Arm Hex Utility*.
2. Select *Output Format Options*. The common selections are *Bin*, *Hex*, and *TI_TXT* format. Select the desired output format options.
3. If the Intel *HEX* format is selected, **one additional step** is required to specify the memory and ROM width as parameters. Select a memory and ROM width of 8in *Properties* → *Arm Hex Utility* → *General Options*.
4. After clicking the *Build* button, the hex file generates in the debug folder.

Step 2: MSPM0 Evaluation

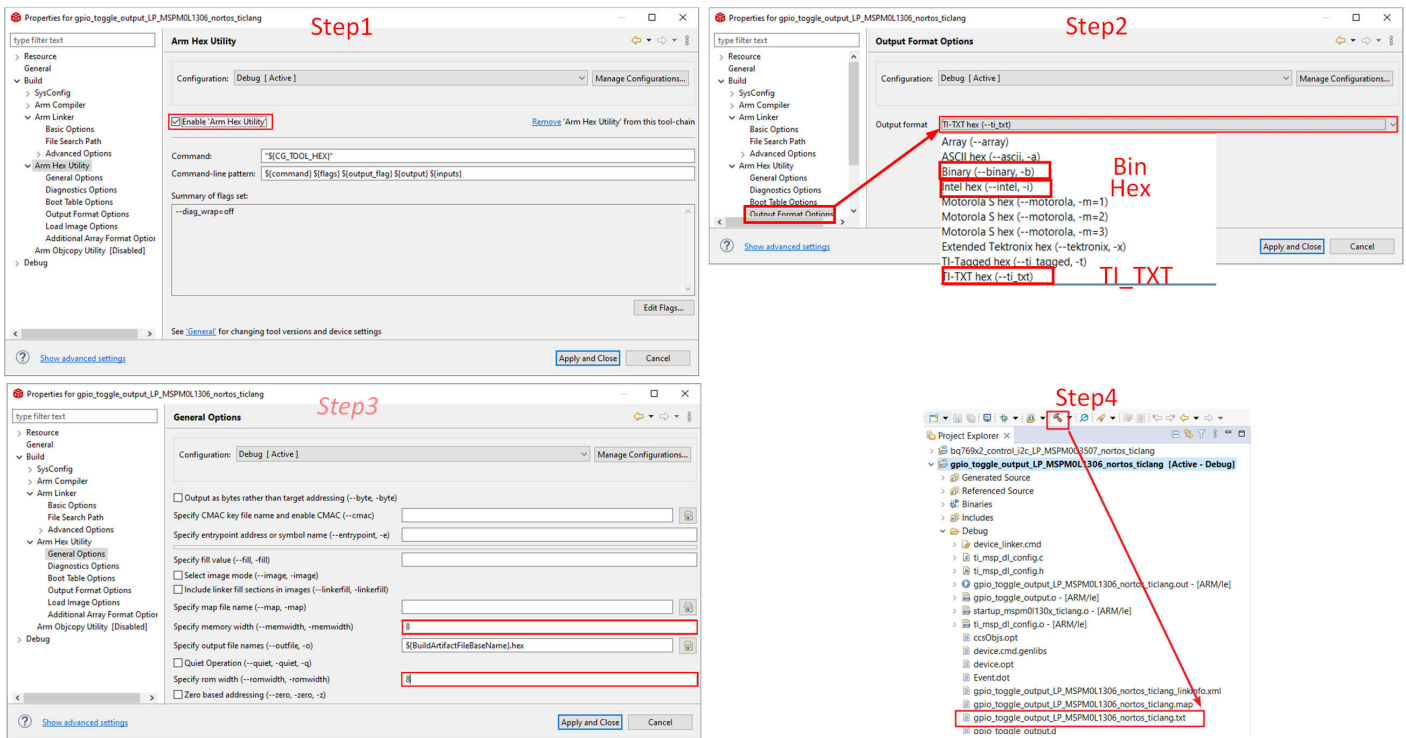

Figure 3-28. Generate Hex File

3.4.1.7 Program NONMAIN

If changes are made on the bootloader or MCU security settings by configuring the NONMAIN as shown in Section 3.3.2.4, enable the NONMAIN erase in the CCS setting as well, as shown in Figure 3-29. Otherwise, keep the default settings.

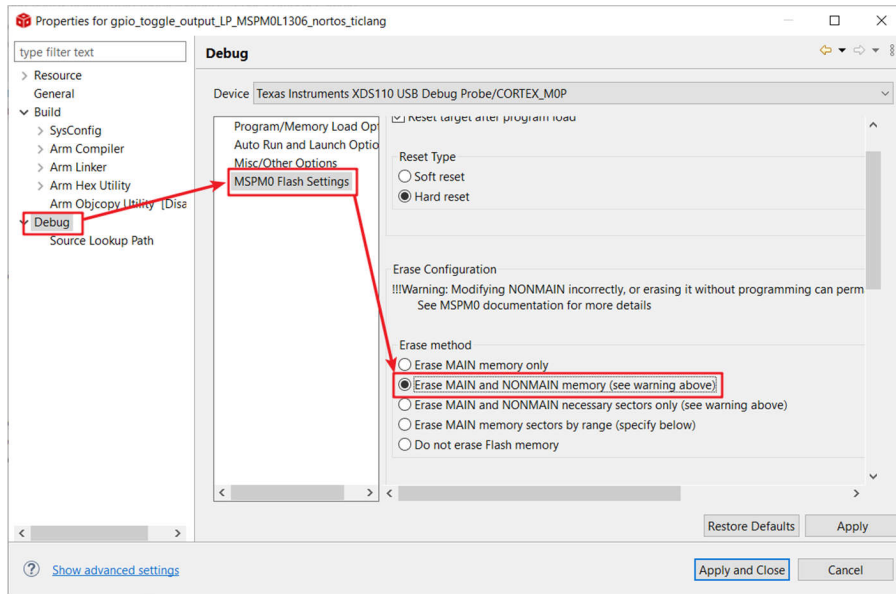

Figure 3-29. Programming NONMAIN

Note

Extreme care must be taken when erasing and programming NONMAIN. If done incorrectly, like losing connection in NONMAIN programming, the device is locked in a permanently unrecoverable state.

3.4.2 IAR Quick Start

TI recommends an IAR Embedded Workbench version higher than Arm 9.32.x. The less recent versions do not support MSPM0.

3.4.2.1 Environment Setup

3.4.2.1.1 SDK Support Setup

In IAR, users must add the latest MSPM0 SDK version. This step only has to be done once, or when the SDK is updated. In IAR, users must add the latest MSPM0 SDK version. This step only has to be done once, or when the SDK is updated.

- Step1: In IAR, click on *Tools* → *Configure Custom Argument Variables*
- Step2: Click the *Global* tab, and then *Import*
- Step3: Navigate to your SDK folder into `<MSPM0_SDK_INSTALL_DIR>/tools/iar/` and open `MSPM0_SDK.custom_argvars`
- Step4: The SDK variables should now be installed in IAR. Click *OK* to close the window

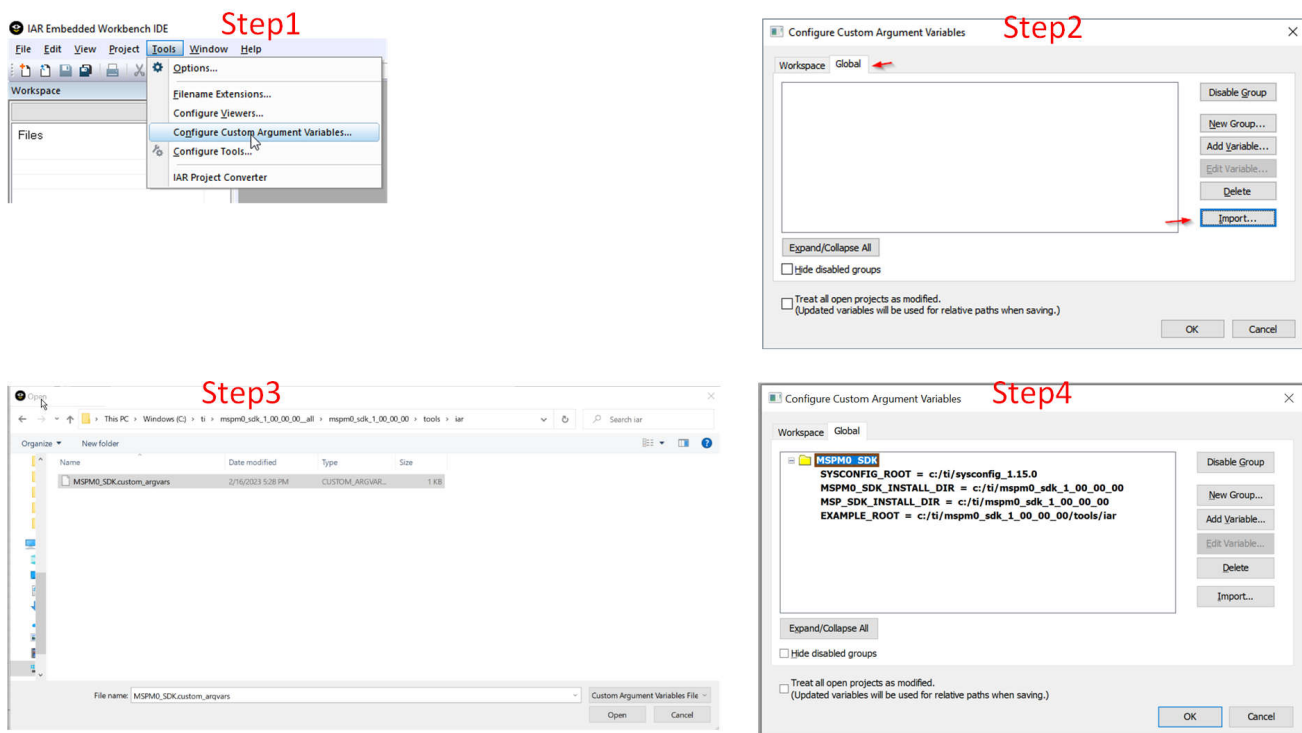

Figure 3-30. Add MSPM0 SDK to IAR

Note

Make sure the MSPM0 SDK path and SysConfig path matches the location and version needed for this SDK release. If an earlier version of the SDK is installed, then make sure to update the path to the current version. If the SysConfig path installed is incorrect or pointing to an older version, then modify the version.

3.4.2.1.2 SysConfig Support Setup

The SDK includes a preliminary version of SysConfig metadata which can be used to evaluate the user experience of MSPM0 SDK.

1. In IAR, select *Tools* → *Configure Viewers* from the menu.
2. Click *Import*.

Step 2: MSPM0 Evaluation

3. Navigate to your SDK folder into `<MSPM0_SDK_INSTALL_DIR>/tools/iar/` and open `sysconfig_iar_setup.xml`.
4. The standalone SysConfig will be associated to `.syscfg` files. Click OK to close window.
5. Double-check that the `SYSCONFIG_ROOT` Custom Argument Variable is correctly pointing to the SysConfig folder.

Figure 3-31. Install SysConfig for MSPM0

3.4.2.2 Import a SDK Example

Here are the steps to import an IAR code example from SDK:

1. In IAR, select *File* → *Open Workspace* from the menu.
2. Navigate to an IAR folder in SDK example at `<MSPM0_SDK_INSTALL_DIR>/examples/` and open the `.eww` workspace file.
3. Click *OK* on the message.
4. Select a folder to install the example.

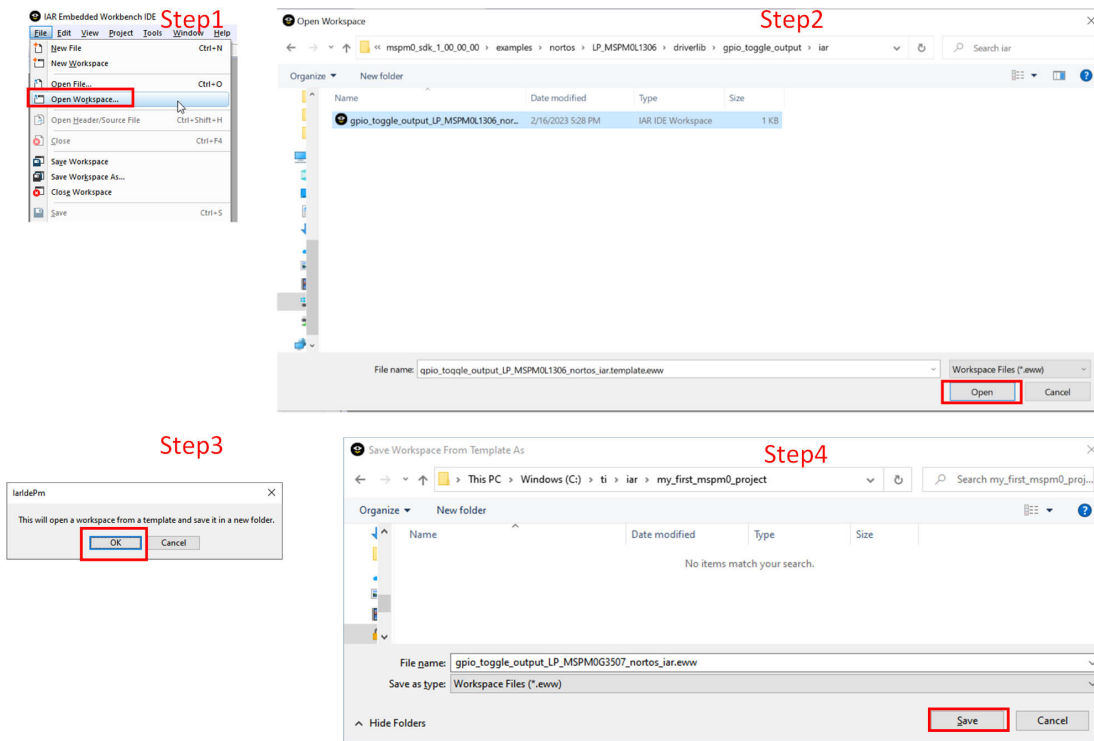

Figure 3-32. Import a SDK Example

Here is a simple instruction to use SysConfig with IAR.

1. Double click on the .syscfg file in your project.
2. This opens SysConfig and allows you to configure peripherals, IO pins, and other settings.
3. Save your changes and switch back to IAR EWARM. Build your code example. The Files in the SysConfig Generate Files folder will be updated.

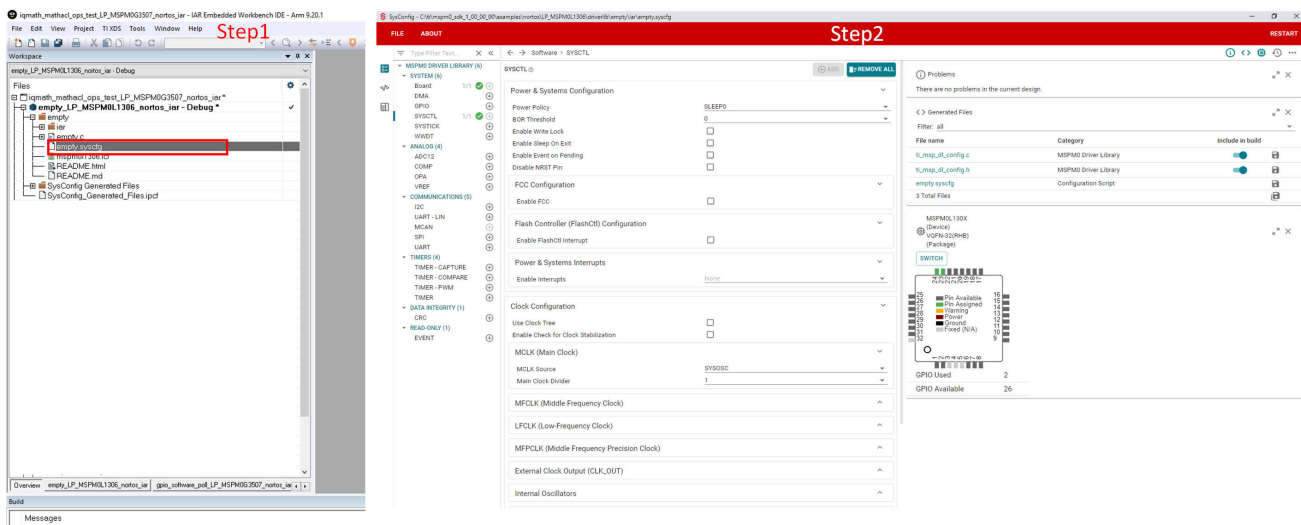

Figure 3-33. Use SysConfig With IAR

3.4.2.3 Example Download and Debug

Here are the steps to build the example under IAR:

1. To build the example, right click in the project and select *Make*. Note that SysConfig projects will automatically generate files in the “SysConfig Generated Files” folder.
2. Click the *Download and Debug* button to download the code.

3. Now you can start to debug your code.

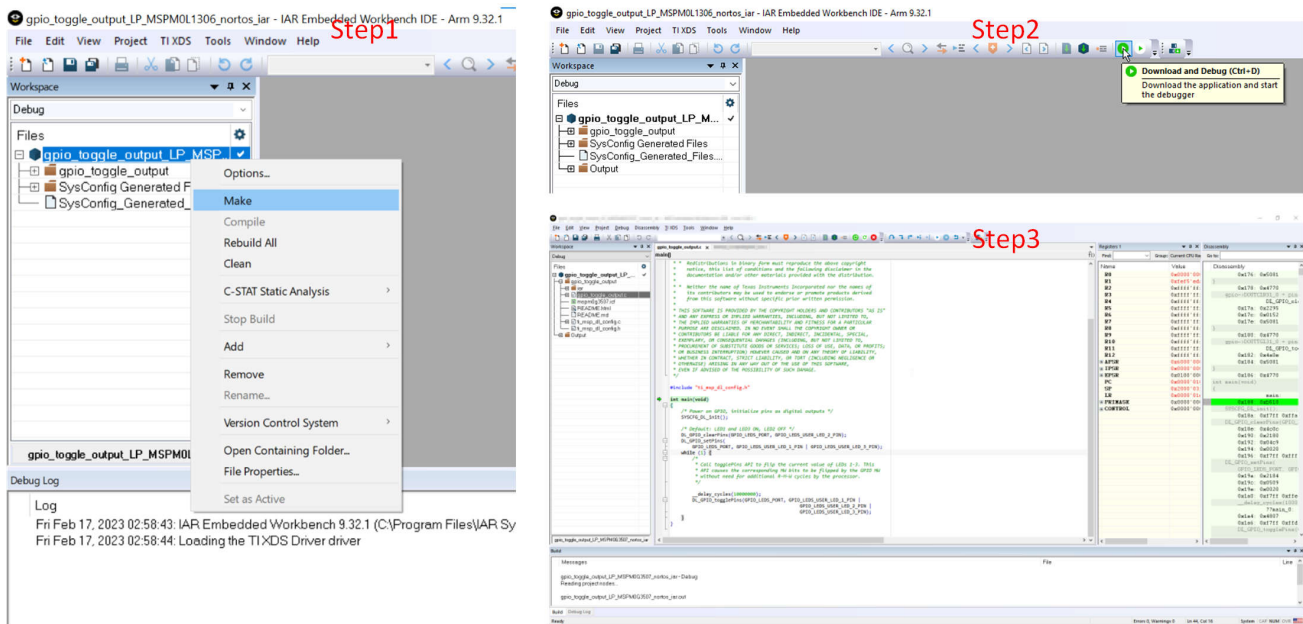

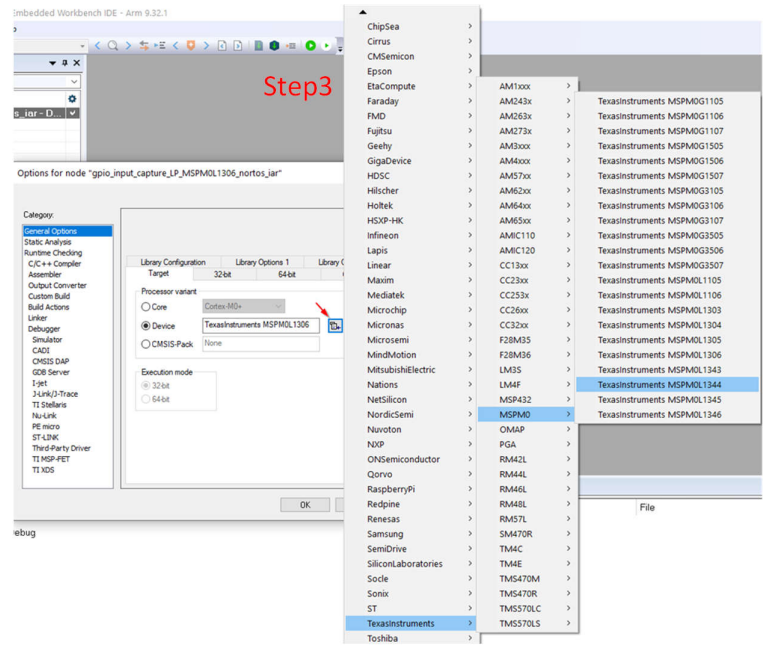

Figure 3-34. Download and Debug

3.4.2.4 Migrating Between MSPM0 Derivatives

SysConfig allows for an easier migration between MSPM0 derivatives. However some manual modifications are required on IAR. Here are the instructions:

1. In SysConfig, enable the Device View and click on **SWITCH**.
2. Select the corresponding options for the new MSPM0 device and click **CONFIRM**. Note that SysConfig highlights any conflicts with the migration, such as unavailable pins and peripherals. Fix any conflicts as needed.
3. In the project options, select **General Options** → **Target** → **Device**. Select the MSPM0 device.
4. In the project options, select **C/C++ Compiler** → **Preprocessor** → **Defined symbols**. Add the device definition as per the device selected.

Step 2

Switch Board or Device

This will migrate the current configuration to the board or device selected below. Any incompatibilities will be flagged as errors.

The migration can be undone by using ctrl + z or the history view. Any underlying project or makefile is not modified, and likely contains device-specific settings. These settings will need to be migrated manually.

Setting	Current Value	New Value
Board	None	None
Device	MSPM0L130X	MSPM0L134X
Part	Default	Default
Package	VQFN-32(RHB)	VSSOP-28(DGS28)
Lock PinMux		<input checked="" type="checkbox"/>

CANCEL CONFIRM

Figure 3-35. Migrating Between MSPM0 Derivatives

3.4.2.5 Generate Hex Files

Here is the instruction to generate hex files in IAR. Click *Project* → *Options* → *Output Converter* → *Generate additional output* → *Output format* → *Texas Instruments TI-TXT*. Intel Hex or other formats also can be selected.

Figure 3-36. Generate Hex Files

3.4.2.6 Program NONMAIN

If you do the changes on Bootloader or MCU security setting by configuring the NONMAIN as shown in [Section 3.3.2.4](#), you need to enable the NONMAIN Erase in the IAR setting as well. Follow the steps below, otherwise, please keep it default:

1. Click *Options* → *Debugger* → *Download* → *Override default .board file* → *Edit*. Select the 2nd element and then click Okay.
2. Add `--non_main_erase` as an extra parameter.

Figure 3-37. Program NONMAIN

Note

Extreme care should be taken when erasing and programming NONMAIN. If done incorrectly like losing connection in NONMAIN programming, the device becomes locked in a permanently unrecoverable state.

3.4.3 Keil Quick Start

3.4.3.1 Environment Setup

Not like IAR, it is OK to use old version Keil, however remember to update the MSPM0 CMSIS-Pack.

3.4.3.1.1 MSPM0 CMSIS-Pack Setup

The Pack installer needs to be installed first before the MSPM0 is developed. Here are the steps to update MSPM0 CMSIS-Pack:

1. In μ Vision, open *Pack Installer* through quick guide or select *Project* \rightarrow *Manage* \rightarrow *Pack Installer*.

Figure 3-38. Open Pack Installer

2. In Pack Installer, search MSPM0 on the left side in the search text box. Then, the corresponding MSPM0 family is shown on the screen.

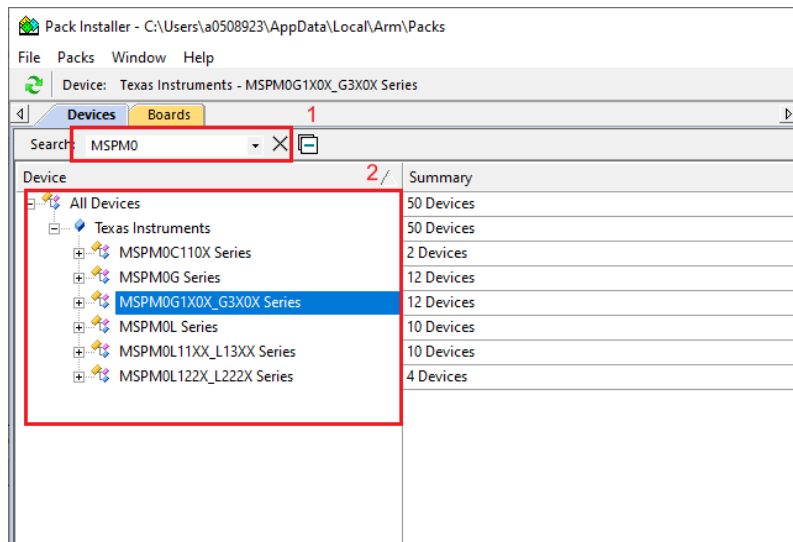

Figure 3-39. Search Device

3. Select the device to install a pack. Then on the right side, install the device-specific pack.

Figure 3-40. Install Device Pack

4. After approving the license terms, the pack is successfully installed.

Figure 3-41. Approve the License

3.4.3.1.2 Sysconfig Support Setup

If SysConfig is required, follow the steps below to enable use. Make sure that SysConfig and SDK are installed ahead. Here, we use SDK v1.30 and SysConfig v1.19 as an example.

1. Navigate to the SDK folder (...\ti\mspm0_sdk_x_xx_xx_xx\tools\keil). Edit SysConfig path in *syscfg.bat* to match the downloaded standalone SysConfig address.

Figure 3-42. Edit syscfg.bat

2. In the same folder, open another file for editing. Modify the SysConfig and SDK versions and paths.

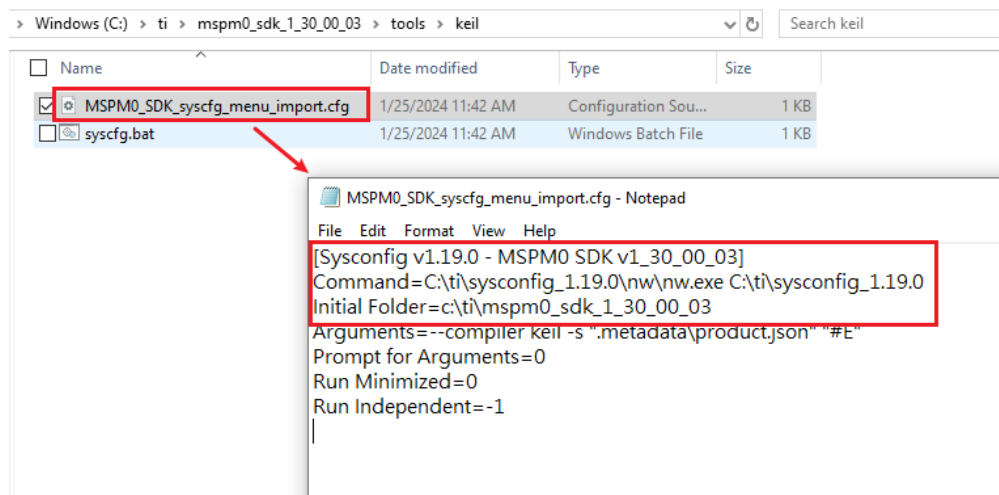

Figure 3-43. Edit MSPM0_SDK_syscfg_menu_import.cfg

3. In Keil, select *Tools* → *Customize Tools Menu* from the menu.

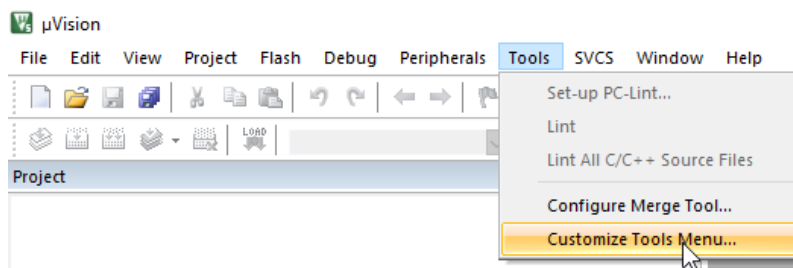

Figure 3-44. Keil Customize Tools

4. Import MSPM0_SDK_syscfg_menu_import.cfg file into the *Customize Tools Menu*.

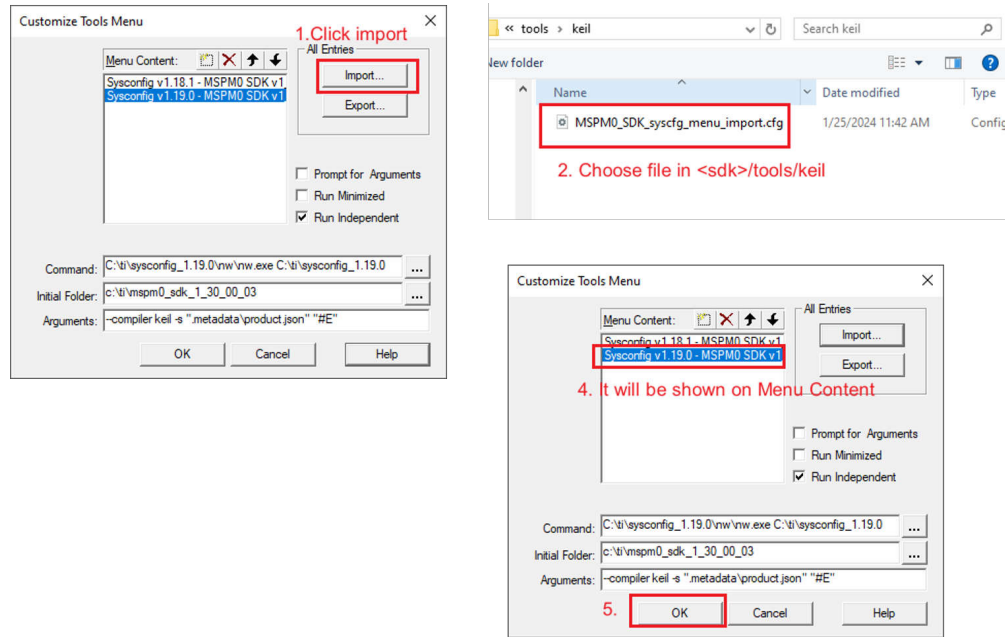

Figure 3-45. Import MSPM0_SDK_syscfg_menu_import.cfg File

5. The SysConfig entrance now appears on the menu. You can use SysConfig for MSPM0 development on Keil.

Figure 3-46. Finish SysConfig Setup

3.4.3.2 Import a SDK Example

Here is the guide that explains how to import a MSPM0 SDK example into Keil:

1. In Keil, select *Project* → *Open Project*.

Figure 3-47. Open Project

2. Select a demo project from SDK. For the nortos example, use the .uvprojx project file. For the RTOS example, use .the uvmpw work space file. An example is shown in [Figure 3-48](#).

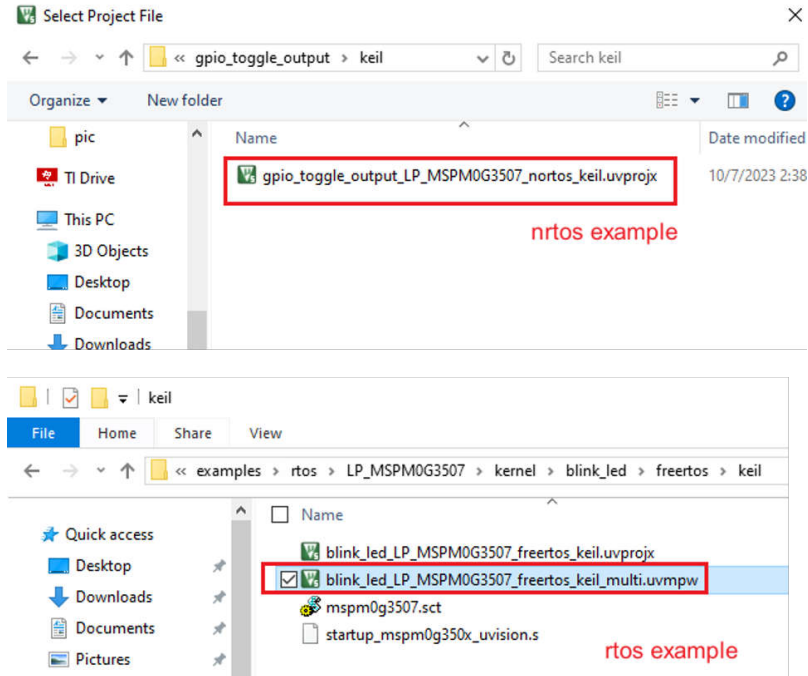

Figure 3-48. Select Keil Project

- To open the .syscfg file, double click the .syscfg file. Then, select *Tools* → *Sysconfig v1.19.0 - MSPM0 SDK v1_30_00_03*. The .syscfg file opens in a separate window.

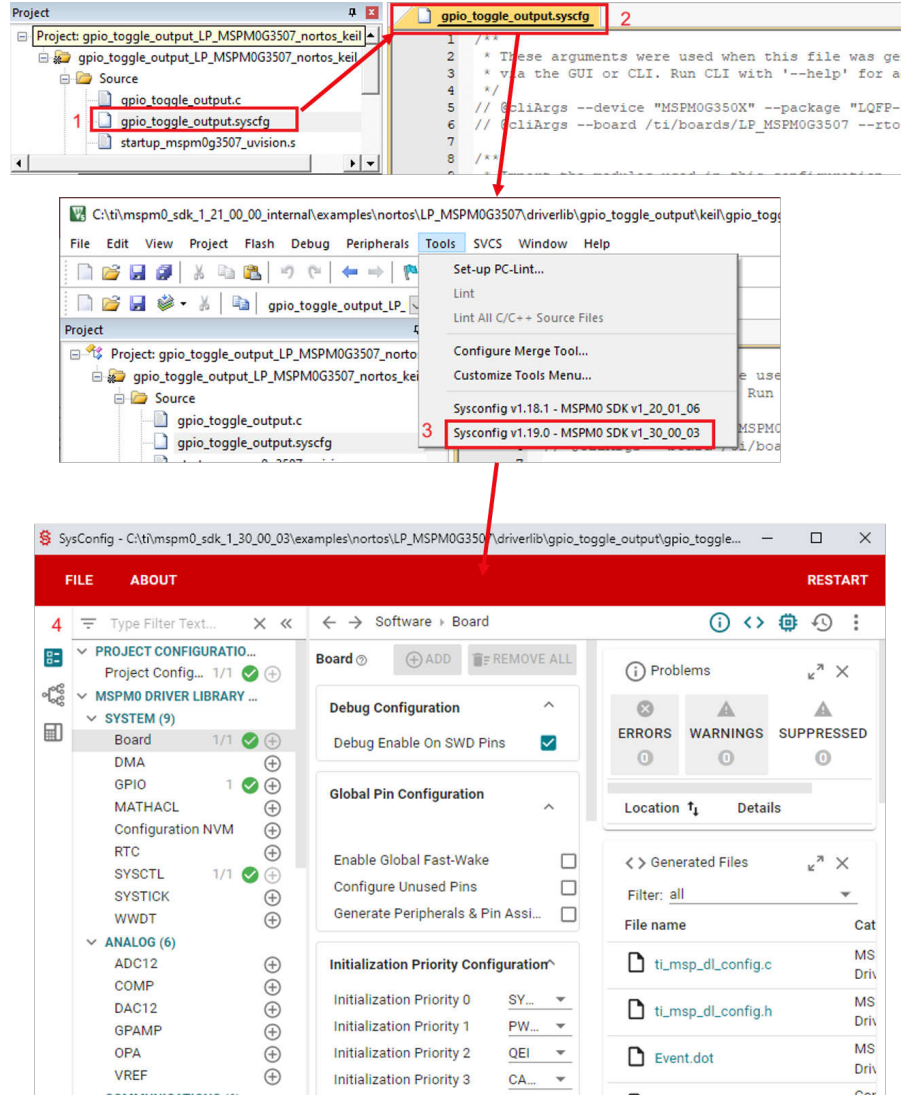

Figure 3-49. Open .syscfg file

3.4.3.3 Example Download and Debug

Here is the guide that explains how to download the code into MSPM0 based on Keil:

- Right click project files, then select "open options for target '...'"

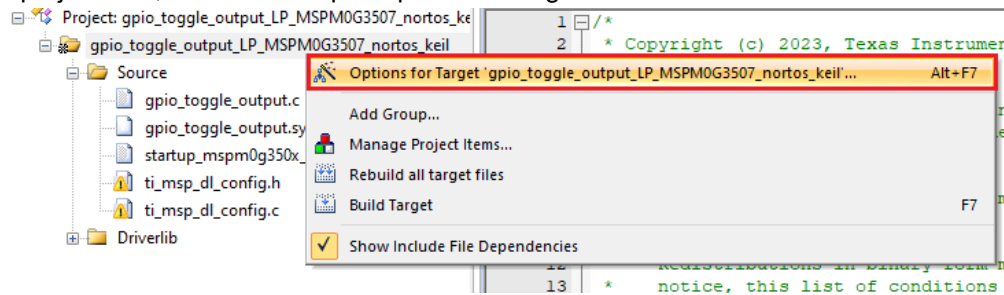

Figure 3-50. Open Options for Target

- Select a debugger from the *Target Options* window. To use XDS-110, select *CMSIS-DAP Debugger*. If J-Link is required, select *J-LINK/J-TRACE Cortex*.

Figure 3-51. Select the Debug Pane

- Click on the *Settings* button. On the *Debug* tab, make sure the settings match with [Figure 3-52](#) and [Figure 3-53](#).

XDS110

Figure 3-52. Check the Setting of XDS110 Probe

J-Link

Figure 3-53. Check the Setting of J-Link Probe

- Click on the *Flash Download* tab and check whether the description matches [Figure 3-54](#). If not match, click on the *Add* button and select the corresponding MSPM0 MAIN option. The device type is *On-chip Flash*. At last select *Reset and Run*.

Figure 3-54. Flash Download Setting

- Click the *Build* button to build the project, then click the *Load* button.

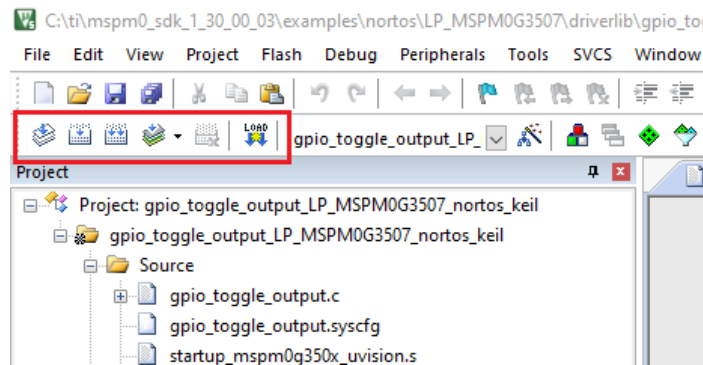

Figure 3-55. Download Project

- To build the FreeRTOS supported example, select *Project* → *Batch Setup* and select all the project targets for the build. Next, select *Batch Build*, it builds all the projects in the workspace.

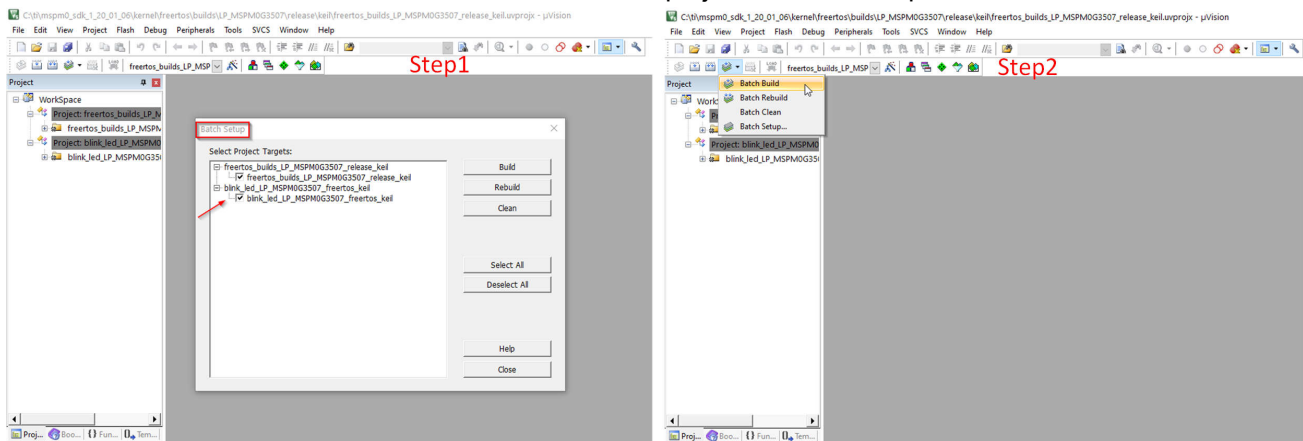

Figure 3-56. Build RTOS Example Under Keil

3.4.3.4 Migrating Between MSPM0 Derivatives

SysConfig allows for an easier migration between MSPM0 derivatives. However some manual modifications are required on Keil. Follow the steps below:

- In SysConfig, enable the Device View and click on *SWITCH*.
- Select the corresponding options for the new MSPM0 device and click *CONFIRM*. Note that SysConfig highlights any conflicts with the migration, such as unavailable pins and peripherals. Fix any conflicts as needed.
- In the Keil IDE, open the *Device* tab in project options, and select the new MSPM0 derivative.
- Update the device definition by selecting *C/C++ (AC6)* → *Preprocessor Symbols* → *Define*. Add the device definition as per the device selected.
- Update the linker file in *Linker* → *Scatter File*. The MSPM0 SDK includes default files for all MSPM0 derivatives at `<sdk>\source\ti\devices\mspm0p\linker_files\keil`.
- Add the startup file of the new derivative to the project and remove existing one. The MSPM0 SDK includes default files for all MSPM0 derivatives at `<sdk>\source\ti\devices\mspm0p\startup_system_files\keil`.

Step 2: MSPM0 Evaluation

Figure 3-57. Migrating Between MSPM0 Derivatives

3.4.3.5 Generate Hex Files

Here is the instruction to generate hex files in Keil. Click *Project* → *Options* → *Output* → *Create Hex File* → *OK*. You can select the paths through click *Select Folder for Objects* to locate the HEX file. The default path is the object folder under project file.

Figure 3-58. Generate Hex Files

3.4.3.6 Program NONMAIN

If you do the changes on Bootloader or MCU security setting by configuring the NONMAIN as shown in Section 3.3.2.4, you need to enable the NONMAIN Erase in the IAR setting as well. Follow the steps below, otherwise, please keep it default:

1. Click *Options* → *Debug* → *Settings* → *Flash Download*.
2. Add the NONMAIN programming algorithm, and then click *OK*.

Figure 3-59. Program NONMAIN

4 Step 3: Hardware Design

4.1 Obtaining a MSPM0 Package

To obtain a MSPM0 package, use the Ultra Librarian tool on TI.com, as shown in Figure 4-1. For detailed instructions, see Appendix A.

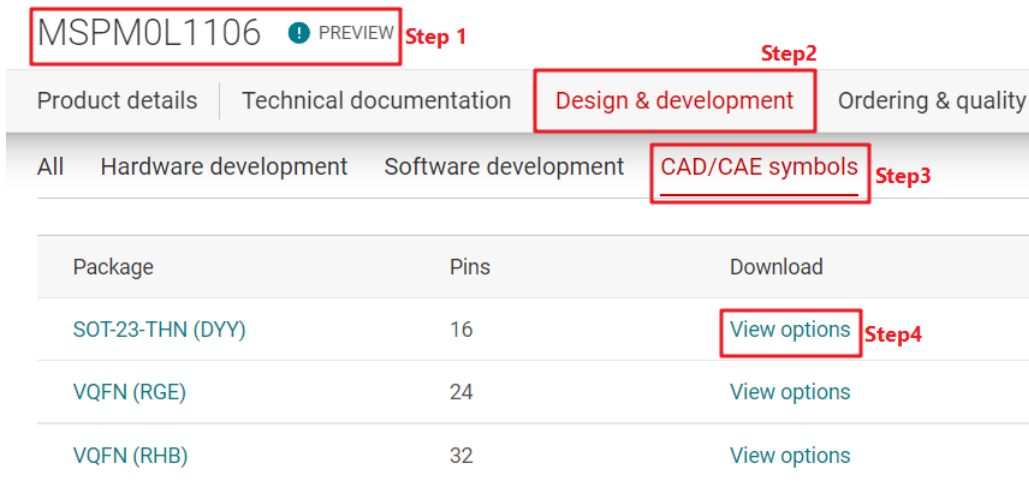

Figure 4-1. Ultra Librarian Tool Entrance

4.2 Fix Pin Functions

TI recommends hardware engineers use the *Peripherals and Pin Assignments File* to fix the pin functions with assistance from a software engineer by following the instructions in Figure 4-2.

Figure 4-2. Generate Peripherals and Pin Assignments File

4.3 Schematic and PCB Generation

Figure 4-3 shows the minimum requirements (power, reset, and Vcore) with suggested values for MSPM0 hardware setup.

- Power pin: TI recommends adding 10uF and 0.1uF capacitors, which are used to remove AC noise on the power rail.
- Reset pin: TI recommends adding a 47kR pullup resistor and a 10nF pulldown resistor. This makes sure that the MSPM0 releases from reset, after the power rail is stabilized. For some MSPM0 devices, the reset pin can be reused with another function, like I2C or UART. TI recommends reducing the resistor and capacitor, such as using a 2.2kR pullup resistor and 10pF pulldown capacitor.
- Vcore pin: This pin is used to stabilize the CPU voltage. For some MSPM0 devices, this pin is not included. If the pin is included, connect the pin to a 0.47uF capacitor.

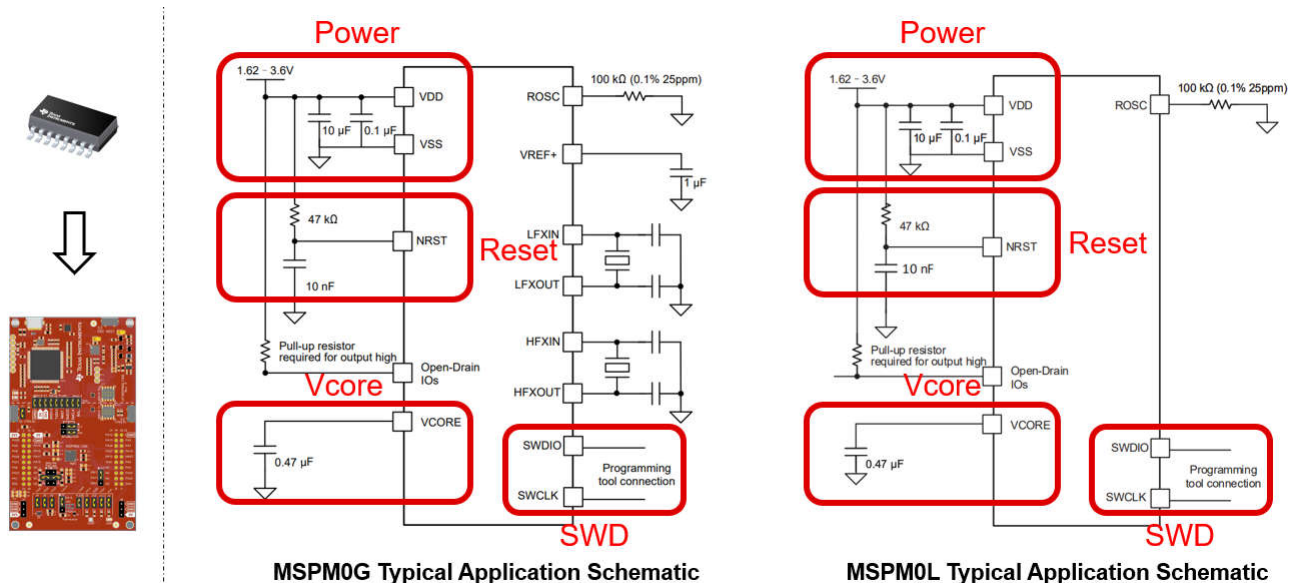

Figure 4-3. MSPM0 Minimum System

Figure 4-4 shows other considerations when drawing a schematic file.

- ROOSC Pin: If users want to reach accurate high frequency clock with internal SYSOSC. A 0.1% resistor is suggested. For some low cost devices, they can not have this function.

- VREF+/VREF- Pin:
 - If using an internal reference, the G series require a 1uF capacitor between VREF+ and VREF- to support 4MSPS ADC. For L or C series, the capacitor is not required, as its ADC speed is only support 200KSPS with internal Vref.
 - If using an external reference, all the MSPM0 devices require a 1uF capacitor between VREF+ and VREF-.
- Open-Drain IO: Open-Drain IO cannot output high voltage from the MCU side, so external pullup resistors are required, such as a 4.7kR capacitor.
- NRST: If reusing the reset pin as GPIO, the pullup resistor and the pulldown capacitor are still required. This makes sure that the MCU is released from reset state after the power is stable.
- PA18: PA18 is the invoke pin to enter bootloader. Make sure this pin is not float or pullup. Otherwise, a user can change and disable the invoke pin in sysconfig, as shown in [Section 6.3](#).

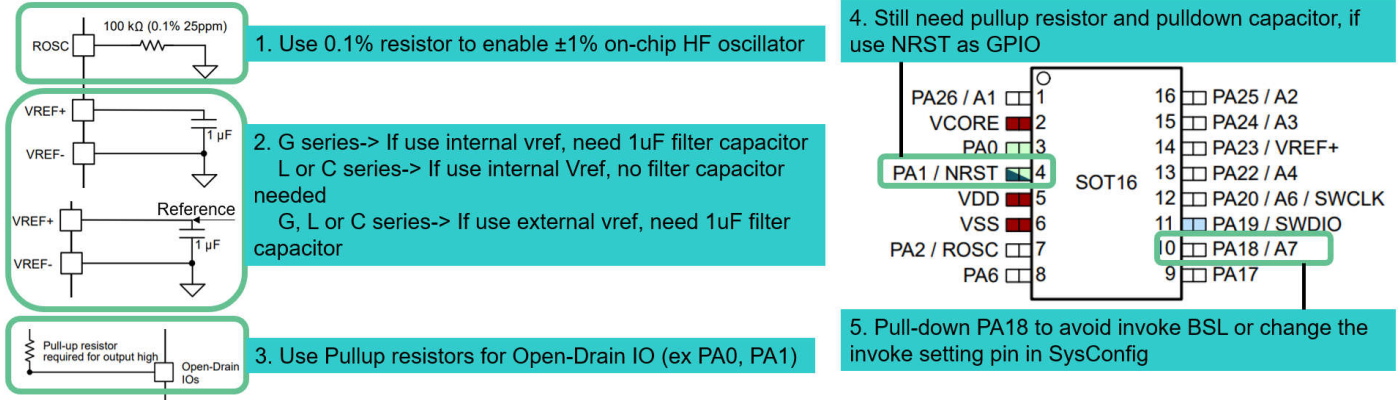

Figure 4-4. MSPM0 Schematic

For further information about schematics or PCB design references, see the following links.

- [MSPM0 L-Series MCUs Hardware Development Guide](#)
- [MSPM0 G-Series MCUs Hardware Development Guide](#)
- Device-specific MSPM0 Launchpad EVM user's guide
- Device-specific MSPM0 data sheet

5 Step 4: Mass Production

Figure 5-1 shows an overview of the program software and tools. The available interface is JTAG (SWD) and Bootloader (BSL). For J-Link only supports SWD. For XDS110 and MSP-GANG supports SWD and Bootloader over UART.

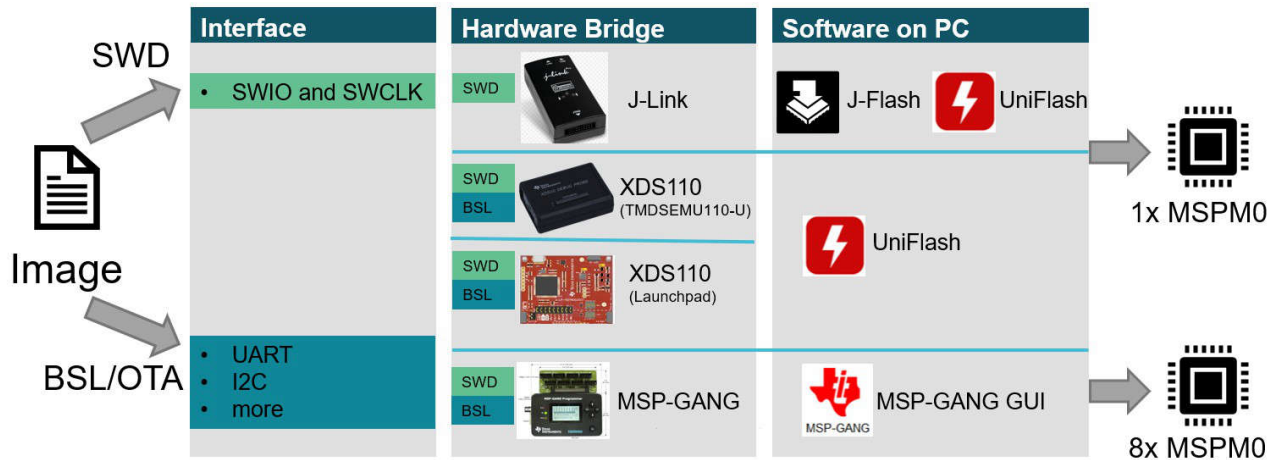

Figure 5-1. Program Software and Tools

For more implementation about bootloader, see [MSPM0 Bootloader \(BSL\) Implementation](#). For more production programming tools, see the following [E2E page](#).

5.1 Generate Production Image

Table 5-1 lists different types of image generated by different IDEs. For the step by step generation guidance, see [Section 3.4](#).

Table 5-1. Product File Generated by IDE

IDE	TI_TXT (.txt)	Intel hex (.hex)	bin (.bin)	Step by Step Guidance
CCS	Y	Y	Y	Link
IAR	Y	Y	Y	Link
Keil	N	Y	N	Link

5.2 Program Software

5.2.1 Uniflash Quick Start

This section describes how to install the UniFlash tool with TI's MSPM0 devices. See the [UniFlash Quick Start Guide](#) for more information.

5.2.1.1 Program Through SWD

The debugging interface such as XDS110 can be used by UniFlash to program the device. The needed hardware pins are SWDIO, SWCLK, 3V3 and GND. Follow the steps below:

1. Follow the steps to select the debugger (either XDS110 or J-Link). Then click *Start* to start program.
2. If NONMAIN must change, change the erase setting before programming. If this is not required, keep the default option.
3. Select the image and start to program by clicking *Load Image*.
4. Using the *Memory* tab, UniFlash can also inspect the flash memory of the device simply by selecting *Read Target Device*.

Figure 5-2. Program Through SWD

5.2.1.2 Program Through Bootloader

Here are the steps to program MSPM0 through bootloader using Uniflash. The required hardware pins are TX, RX, 3V3, GND and invoke pins.

1. Search the device name and select the bootloader option for the device.
2. Check the COM port by referring to the device manager.
3. Check the UART Bootloader port by referring to the data sheet.
4. Finish the hardware connection (RX, TX, 3V3, GND, Invoke) and start program.

Figure 5-3. Program Through Bootloader

5.2.1.3 Program Through CMD Line Interface

For this requirement, see this [E2E](#) thread.

5.2.2 JFlash Quick Start

This instruction is based on J-Flash V7.92n. TI recommends using the latest J-Flash version, which supports all the latest versions of MSPM0. Use the following steps to program MSPM0 with J-Flash:

1. Click *New project*.
2. Select the related MSPM0 part number.
3. Select the desired programming memory. If NONMAIN does not need to change, deselect *NONMAIN memory*.
4. Click *Connect device* and click *Production Programming*.
5. A confirmation screen appears.

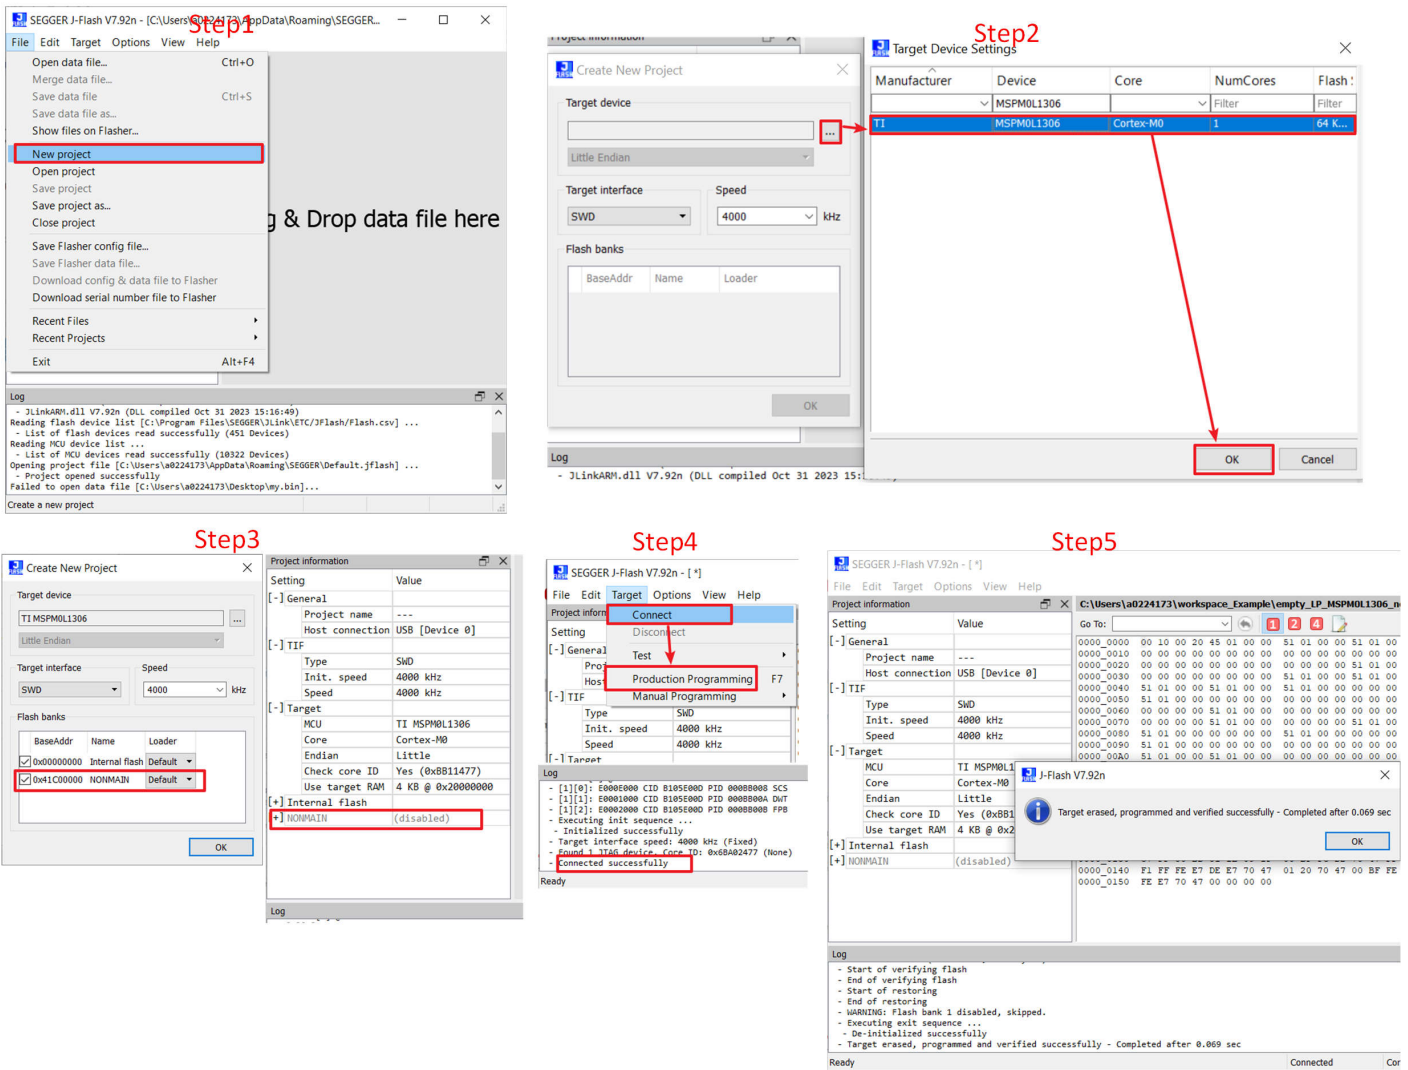

Figure 5-4. J-Flash Quick Start

5.2.3 MSP-GANG GUI Quick Start

The MSP Gang Programmer (MSP-GANG) is a device programmer that supports MSPM0L110x, MSPM0L130x, MSPM0G150x, MSPM0G350x. **At this time, any MSPM0 devices not stated above will not be supported by the MSP-Gang Programmer.** Please refer to this [E2E page](#) for alternative production programming tools.

For the quick start guidance for MSP-GANG, please refer to [Section A.3](#).

5.3 Program Hardware

Because J-Link is commonly used, this section will focus on the XDS110 debugger. For more production programming tools, see the following [E2E page](#).

There are four different types of XDS110 debuggers available. The summary table is listed [Table 5-2](#).

Table 5-2. XDS110 Debugger Summary

Support Features	XDS110		XDS110 On Board	
	TMDSEMU110-U	MSPM0 LaunchPad	LP-XDS110	LP-XDS110ET
JTAG	Yes	No	Yes	Yes
SBW	Yes	Yes	Yes	Yes
EnergyTrace	Yes	Rely on type	No	Yes
MSPM0 bootloader	Yes	Rely on type	No	No
Comment	Highest Performance	Cheapest	Easy to use	Easy to use

With the [TMDSEMU110-U](#) device, [Figure 5-5](#) shows the pin that is used. When using for bootloader, GPIOOUT0 must connect to the MCU reset pin. GPIOOUT1 must connect to the MCU invoke pin (PA18).

Figure 5-5. Pin Connection of TMDSEMU110-U

For XDS110 on LaunchPad, the basic programming functions are intact compared to the TMDSEMU110-U. The board is shown in [Figure 5-6](#). The cheapest XDS110 on LaunchPad is [LP-MSPM0C1104](#). However, [LP-MSPM0C1104](#) only supports SBW and there is no EnergyTrace or bootloader function.

Figure 5-6. XDS110 On Board

LP-XDS110 and LP-XDS110ET are similar with XDS110 on a LaunchPad. Their difference lies on that one has EnergyTrace function and the other does not. The pin assignment is shown in Figure 5-7.

For LP-XDS110 and LP-XDS110ET, the level shift function is enabled by changing the jumper at the left bottom of the board. The support voltage range is from 1.2V to 3.6V.

Figure 5-7. LP-XDS110ET

6 Common Questions

This section lists some common questions for users to search. For further questions, search the device-specific data sheet, technical reference manual, or E2E. TI engineers provide response in 24 hours on this online support platform.

Ask a new question

Log in or create a free myTI account to post a new question and connect with our engineers.

For non-design-related questions such as ordering semiconductor parts and tools, contact our customer support center where you can open a support ticket, chat with us 24 hours a day, Monday through Friday; or call the TI support team.

Figure 6-1. E2E Online

6.1 MSPM0 Program Failure

If the program failure is met for the first time, please check these items one by one:

1. Install the latest IDE or programming software tools at the English path. The default install path is suggested. For install instructions, please see the related chapter in this note.
2. Plug in the debugger and check whether it is found by the computer. If it does not show like Figure 6-2, check for computer limitations.

Figure 6-2. Device Manager View

3. Try to program with MSPM0 Launchpad. As you don't need to care about the hardware setup, this step can ensure your software setup is OK.
4. For your customized board, please first check the schematic by referring to [Section 4.3](#). Pay attention to the Vcc, Vcore and reset pin setting.
5. Then check the hardware connection. You can use multimeter to directly check the signal path at debugger side by referring to [Section 5.3](#), and at MCU pin side by referring to the related data sheet.
6. Use a multimeter to check the power supply on the board. If it is powered from debugger, please remember its power output has limitation. If it is powered from board, you don't need to connect 3V3 pin. If your system power supply is not 3V3, LaunchPad is not suggested. you can use LP_XDS110 and change the power mode.
7. Use oscilloscope to check the signal wave on SWDIO and SWCLK, especially when the wire is very long. Please ensure the signal establishment time is enough.

If the program failure is met for the second time and the device can be programmed before, please refer to [Section 6.2](#).

6.2 Unlock MCU

MSPM0 can lose connection after downloading a wrong code, and CCS reports errors when programming a new code. An example is shown in [Figure 6-3](#).

Figure 6-3. CCS Error

The Debug Subsystem Mailbox (DSSM) enables a debug probe to pass messages to the boot ROM of an MSPM0 device through the SWD interface. There are four unlock commands that you can choose in tools. The brief introduction is in [Table 6-1](#). DSSM Factory Reset is recommended, which the reset level is higher than DSSM Mass Erase.

Table 6-1. Unlock Commands

Unlock Commands	Hardware Connection With Debugger	Reset Pin Control	Command Influence
DSSM Factory Reset Manual	3v3, GND, SWDIO, SWCLK, Reset	End users	Erase main flash and reset NONMAIN flash
DSSM Factory Reset Auto		Debugger	
DSSM Mass Erase Manual		End users	Erase main flash
DSSM Mass Erase Auto		Debugger	

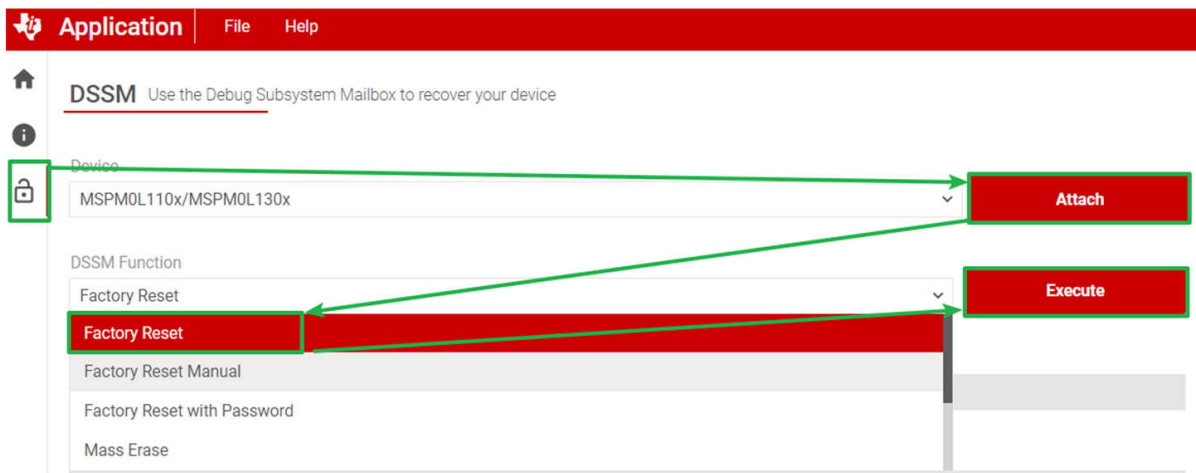

Table 6-2 shows the suggestion on the provided three unlock methods.

Table 6-2. Unlock Method Selection

Unlock Method	When to Choose
Factory Reset GUI Tool	Internet connection is available
Uniflash	Internet connection is unavailable
CCS	Use CCS as the development IDE

6.2.1 Unlock Through Factory Reset GUI Tool

The [MSPM0 Factory Reset GUI tool](#) is a standalone tool used to gain debug access or recover an MSPM0 device using this interface. This tool is available free of charge. Follow the steps to reset the MSPM0.

Output console

```

CS_DAP_0: GEL Output: SEC_AP Reconnect
CS_DAP_0: GEL Output: Command execution completed.
CORTEX_M0P: GEL Output: Factory Reset executed. Please terminate debug session, power-cycle and restart debug session.
DSService deconfigured. Core deattached/closed.
    
```

Figure 6-4. Unlock Through GUI

6.2.2 Unlock Through Uniflash

For Uniflash above Version: 8.7.0.4818, it also supports to unlock MSPM0. First you need to follow the steps in [Section 5.2.1.1](#) to connect the MSPM0 with Uniflash. Then you can follow the instructions in [Figure 6-5](#) to unlock MSPM0.

Figure 6-5. Unlock Through Uniflash

6.2.3 Unlock Through CCS

Here are the steps to unlock MSPM0 through CCS:

1. On the CCS menu, select *View* → *Target Configurations*. On the *Target Configurations* window, right-click the .ccxml of an active project and select *Launch Selected Configuration*.
2. Click *Debug Probe*, and select *Scripts* → *MSPM0xxx_Commands*.
3. If you choose manual command, you need to reset the device according to the command in the console. After that, you can repower the device. If you choose auto command, you can repower the device following the instruction.

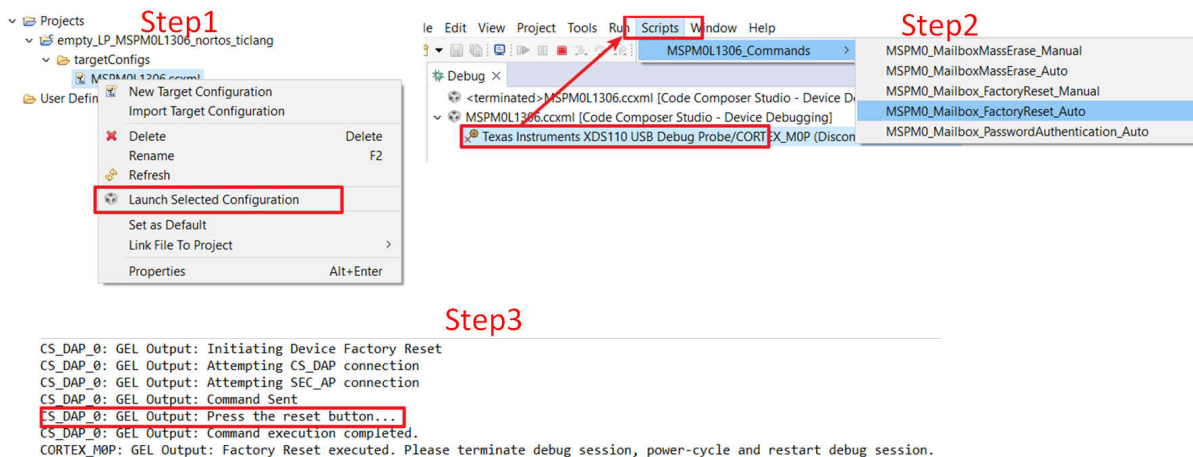

Figure 6-6. Unlock Through CCS

6.3 MCU Performs Differently in Debug and Free Run

MSPM0 performs differently in debug and free run. Check the setting on PA18. The device enters the Bootloader in free run mode after MSPM0 is reset, when PA18 input is low. If PA18 cannot be pulled high, you can follow the steps in [Figure 6-7](#) to disable BSL or change the invoke pin assignment.

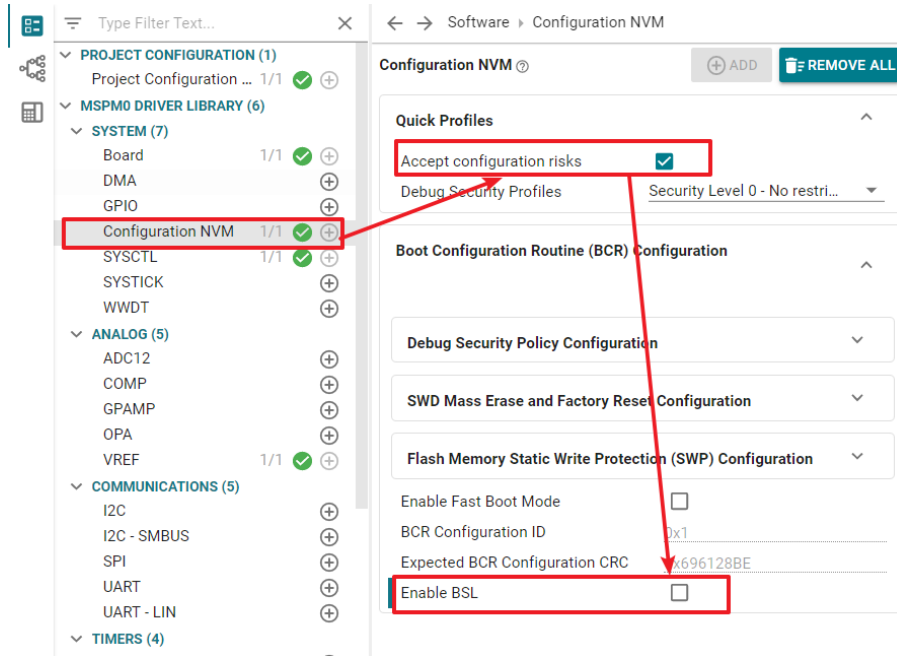

Figure 6-7. Disable BSL

6.4 BSL Related Questions

For questions about how to use bootloader, see [MSPM0 Bootloader \(BSL\) Implementation](#). This provides an overview of bootloader implementation and step-by-step instructions.

For questions about bootloader protocol and its spec, see the [MSPM0 Bootloader User's Guide](#).

6.5 Set SWD Password

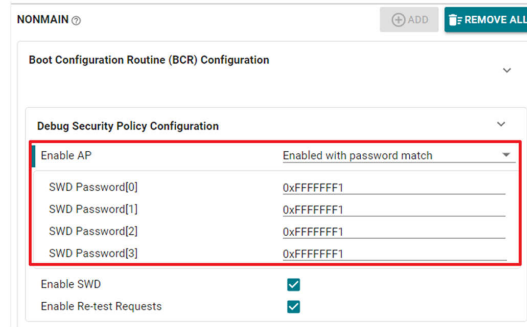

The SWD interface can be configured to be disabled, enabled, or enabled with a 128-bit password by writing the BOOTCFG0 and SWDPW registers in NONMAIN. See the device Technical Reference Manual for more information about NONMAIN and SWD password. You can follow the steps to add password on SWD.

Step1: Change AP Setting, and add password

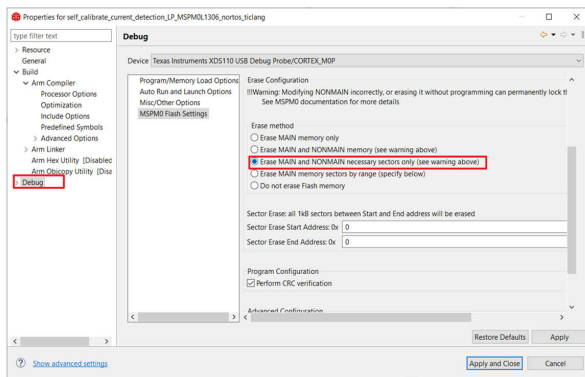

a:

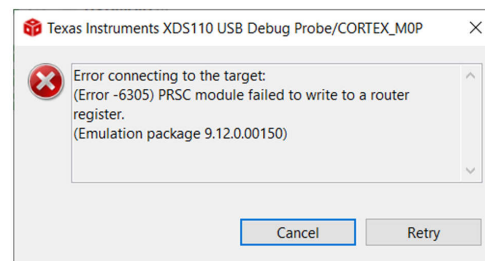

b:

Step2: Enable NONMAIN Erase

Step3: Repower, Device is locked

SBW security will work only after repower!

Figure 6-8. Enable SWD Password

Here are the steps to reprogram MSPM0 with the password. This action doesn't erase NONMAIN, so the password remains active unless NONMAIN is modified.

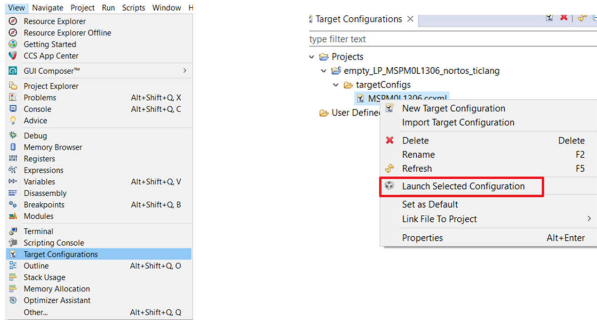

Step1: Input Password in CCS

Step3: Connect Device with Password

Step2: Launch Configuration

Step4: Reprogram

Figure 6-9. Reprogram Device

6.6 CCS Common Questions

In this part, some common questions met in CCS are introduced. Here are some additional documents for your reference when meeting questions with TI's compiler, linker or IDE:

- [ARM Assembly Language Tools User's Guide](#)
- [ARM Optimizing C/C++ Compiler User's Guide](#)
- [TI Arm Clang Compiler Tools User's Guide](#)

6.6.1 Setting Breakpoints at Wanted Places

The default SDK example is with optimization level 2. The code size is smaller. However, this causes a mismatch of the C code and the assembly code and breakpoint cannot be added at the certain C code line. To solve this issue, choose the optimization from level 2 to level 0.

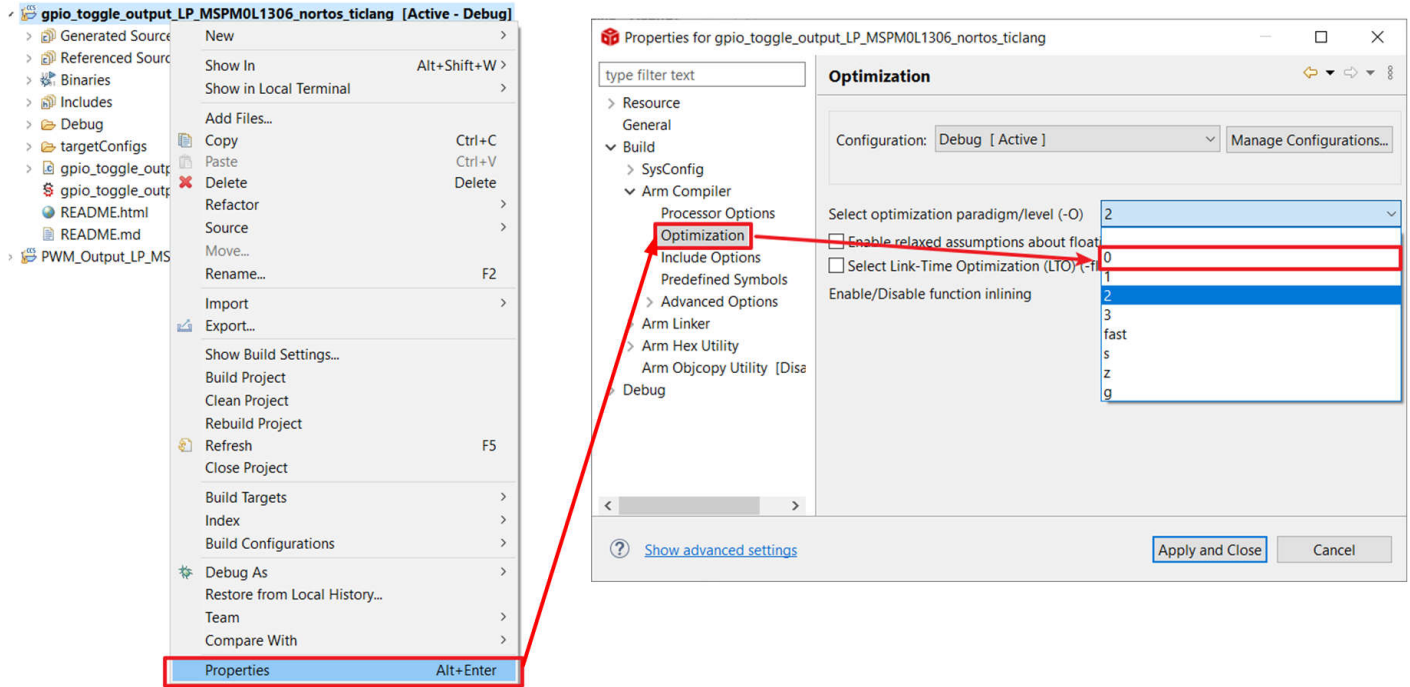

Figure 6-10. Change Optimization Level

6.6.2 Discovered Projects Become Gary

CCS has a workspace concept. If the workspace contains a project with the same name, when a new project is imported, the new project cannot be selected. This problem occurs when the project is deleted without deleting the copy in the workspace. An example is shown in Figure 6-11.

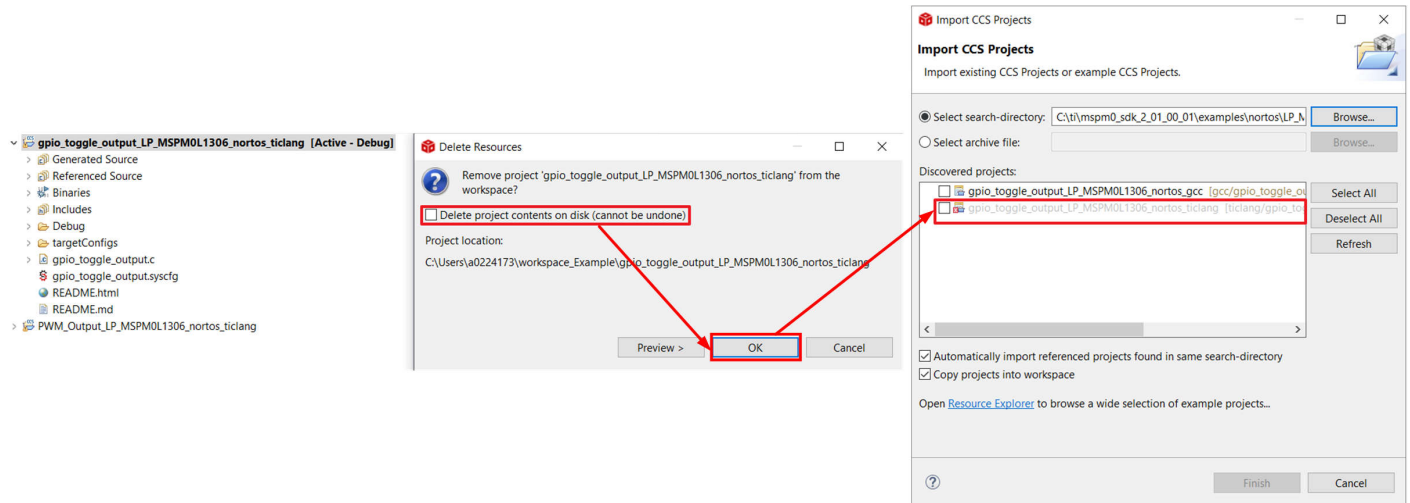

Figure 6-11. Project Cannot be Selected

Follow these steps to solve this problem:

1. Open the workspace address.
2. Copy the workspace address and navigate to the project folder.
3. Remove the duplicated project.
4. Reimport the project.

Figure 6-12. Remove Project With the Same Name

6.6.3 CCS Cannot Locate .h File

Some users find that after debug that CCS produces an error that the .h file cannot be located, which is already in the project. The reason is that CCS does not include the .c and .h files in the imported folder and users need to add the link. Follow the steps to add the folder into include address:

Figure 6-13. Cannot Locate .h File

6.6.4 Install Arm GCC

The MSPM0 SDK includes examples supporting both TI Arm Clang and GCC; however, TI Arm Clang is installed by default in CCS, while GCC is not. Here are the steps to enable CCS support Gcc.

1. GCC can be installed by selecting *Help* → *Install GCC ARM Compiler Tools*
2. Select the version to install. CCS and the MSPM0-SDK only include and support some versions of the toolchain.
3. If the installation was successful, click on *Window* → *Preferences*, then *Code Composer Studio* → *Build* → *Compilers* to see a list of the compilers installed in CCS.

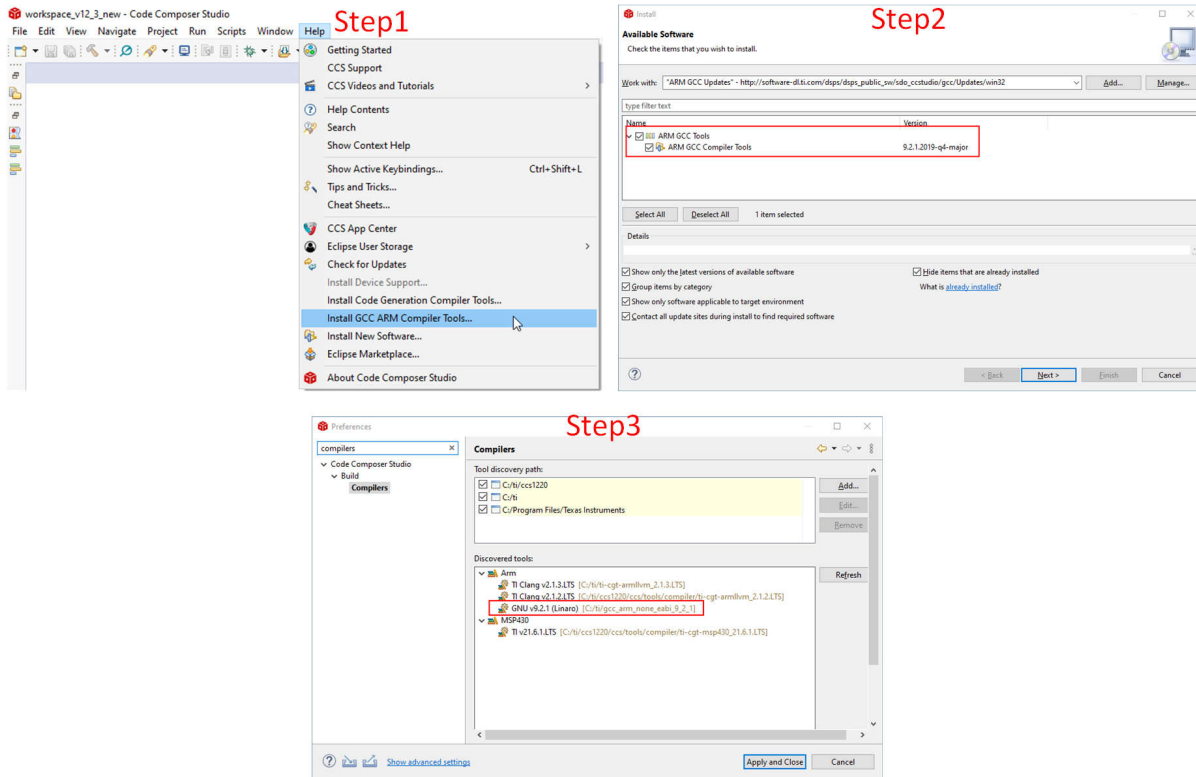

Figure 6-14. Install Arm Gcc

6.6.5 Device is Not Connected After Entering Debug

Sometimes after entering debug mode, there can be an error that the MCU is not connected and the PC does not jump to main function automatically. This can happen when the project name changes and the IDE cannot find the correct debug information.

For this condition, delete the debug folder. Right click the project and enter *Properties*, follow the steps in [Figure 6-15](#) to restore the default debug setting.

Figure 6-15. Restore Default Debug Setting

6.6.6 Erase the Wanted Memory

Some users want to realize the customized memory erasing. The *Erase Method* entrance is shown in [Figure 6-16](#). The default setting is option 1 that it will only erase the total memory. When users want to erase the NONMAIN additionally, they can select the option 2. When users want to keep some memory range not to be erased, they can choose option 3 or option 4 with the declared memory range.

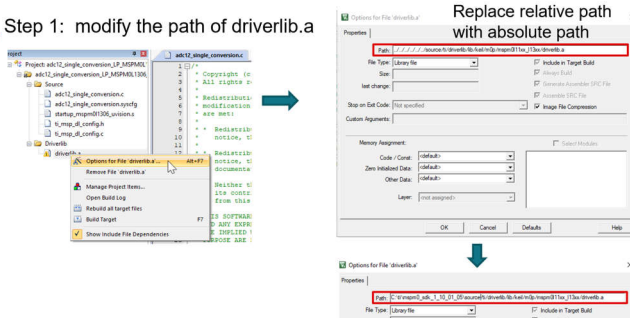

Figure 6-16. Erase the Wanted Memory

6.7 Keil Common Questions

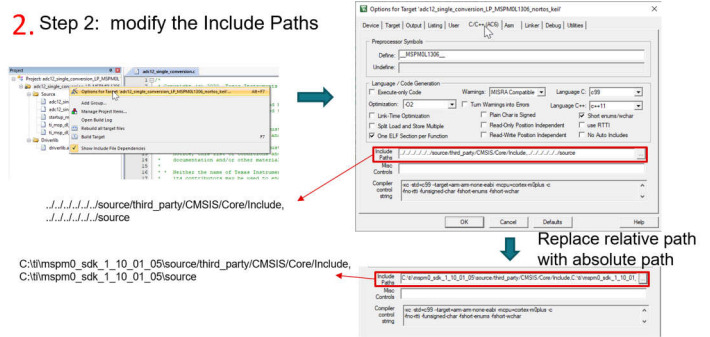

6.7.1 Copy Keil Example Out of SDK

If example code is copied out of SDK and compiled directly, there will be errors. The root cause lies on the SDK and SysConfig address setting in the code example. To solve this problem, see [Figure 6-17](#).

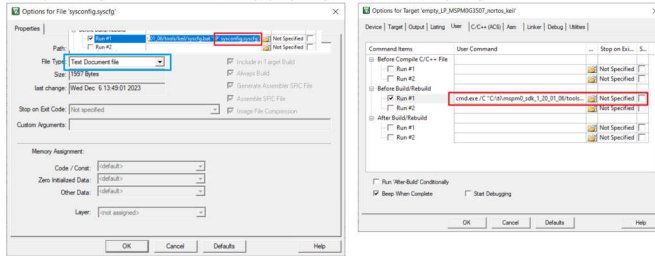

1. Step 1: modify the path of driverlib.a

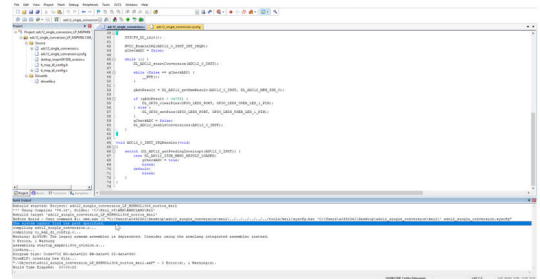

2. Step 2: modify the Include Paths

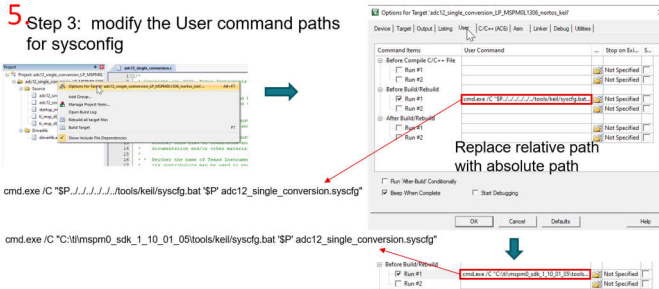

3. If you copy the sysconfig, change the file type to text and may need change the sysconfig name like from empty.syscfg to username.syscfg

4. Now you can compile normally, but SysConfig still cannot be used

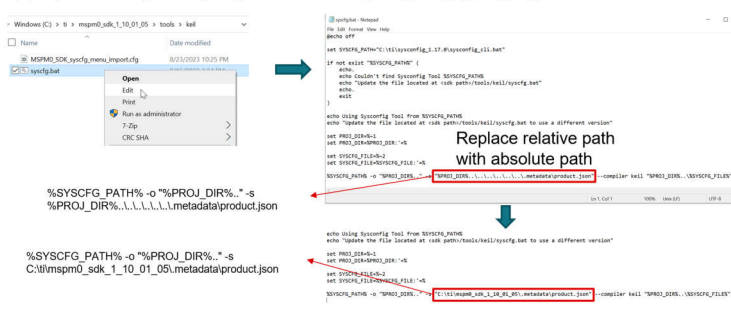

5. Step 3: modify the User command paths for sysconfig

6. Step 4: modify the tools configuration for sysconfig, import from SDK<MSPM0_SDK_INSTALL_DIR>/tools/keil

7. Step 5: modify the syscfg.bat in C:/ti/msp0_sdk_1_10_01_05/tools/keil

8. Now you can use SysConfig normally. Don't put the Keil project under an address name with ". For example, use "My_path" instead of "My path".

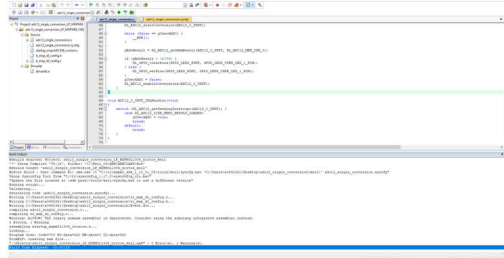

Figure 6-17. Copy Keil Example Out of SDK

A Appendix

A.1 Light an LED and CCS Quick Introduction

This section discusses how to light an LED based on CCS from start to finish. A short description of CCS is also provided to users with instructions on how to use the tool.

A.1.A Install CCS and SDK

Here are the important steps and tips for CCS installation.

1. Download [CCS](#) (above 12.2 version) and start installation, and keep pressing next.

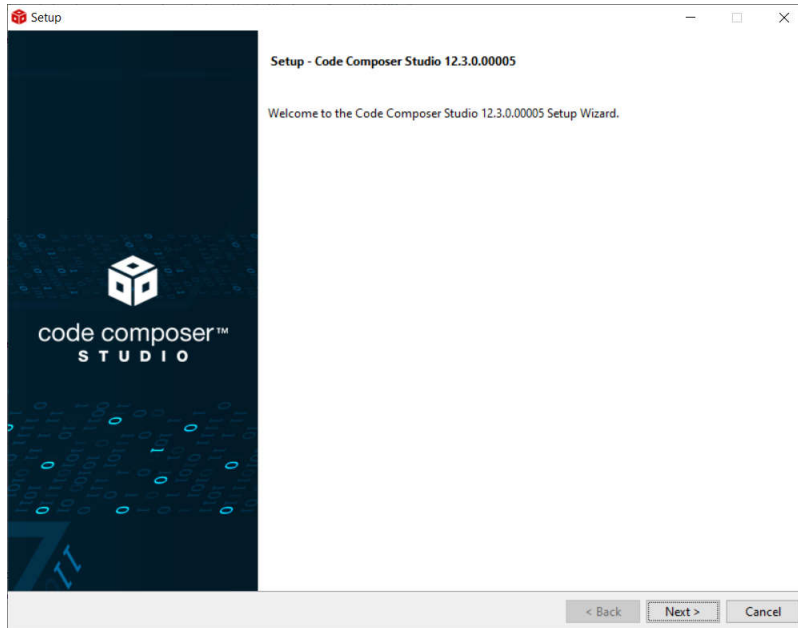

Figure A-1. CCS Installation

2. Select MSPM0 support component.

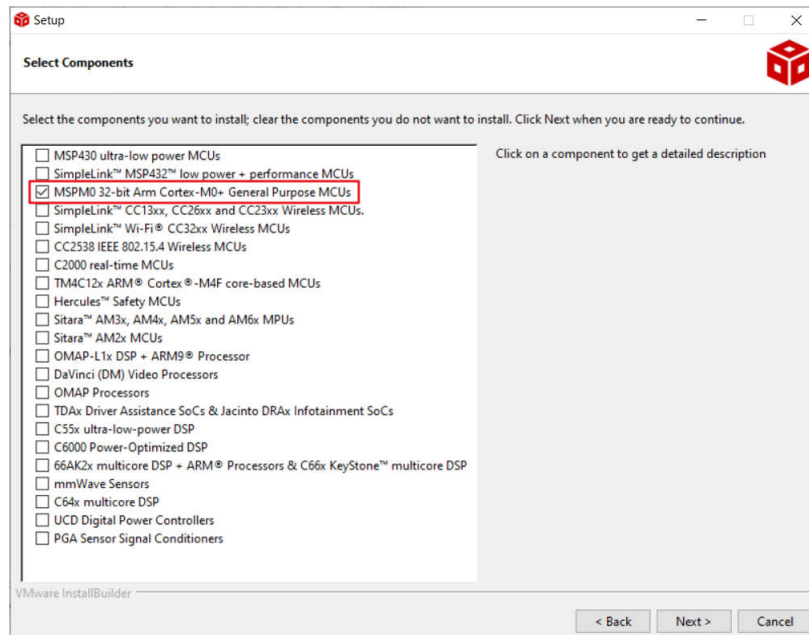

Figure A-2. MSPM0 Support Selection

3. Select J-link if needed.

Figure A-3. J-Link Selection

4. Install [MSPM0 SDK](#).

A.1.B Hardware Setup

Get a launchpad and plug in the computer.

Figure A-4. Hardware Setup

A.1.C Code Import

1. Open CCS. The workspace means the address where to copy your imported project.

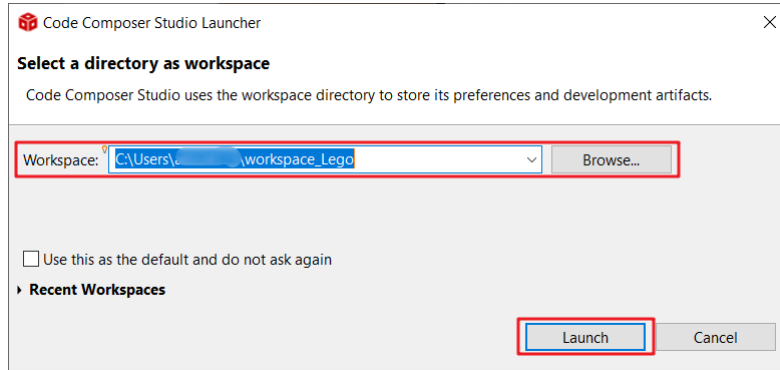

Figure A-5. Choose CCS Workspace

2. Import the general-purpose input/output (GPIO) toggle project with the TI-Clang compiler.

Figure A-6. Import Project

3. If it cannot be imported, delete the same name project under workspace.

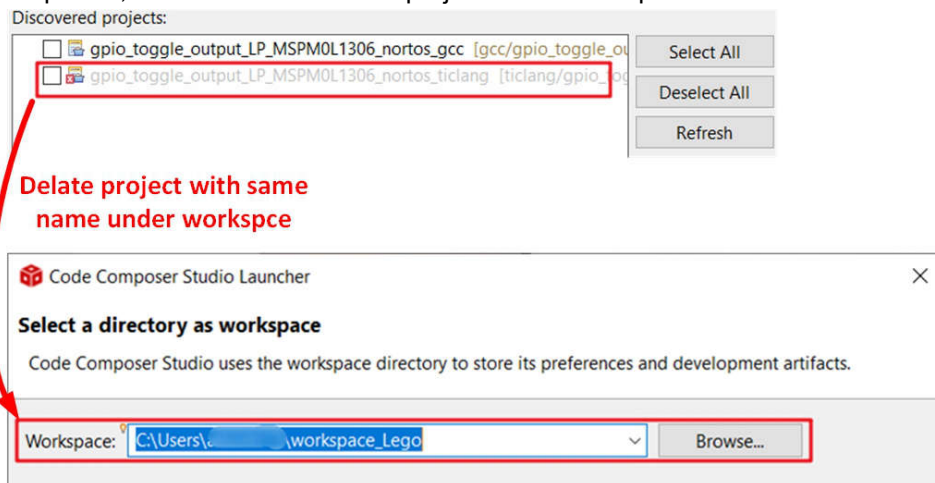

Figure A-7. Remove Duplicated Project

A.1.D Debug and CCS Quick Introduction

1. Start debug, then you can see GPIO toggle on the LP.

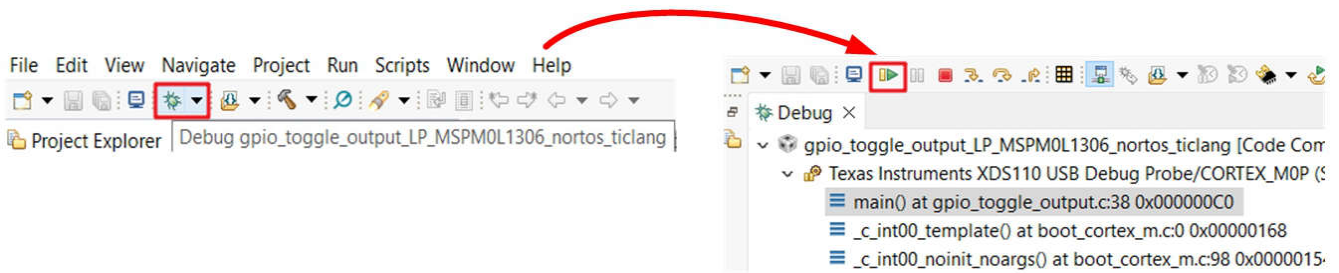

Figure A-8. Debug Code

2. Here we give a quick introduction to CCS functions.

a. Project properties common used settings:

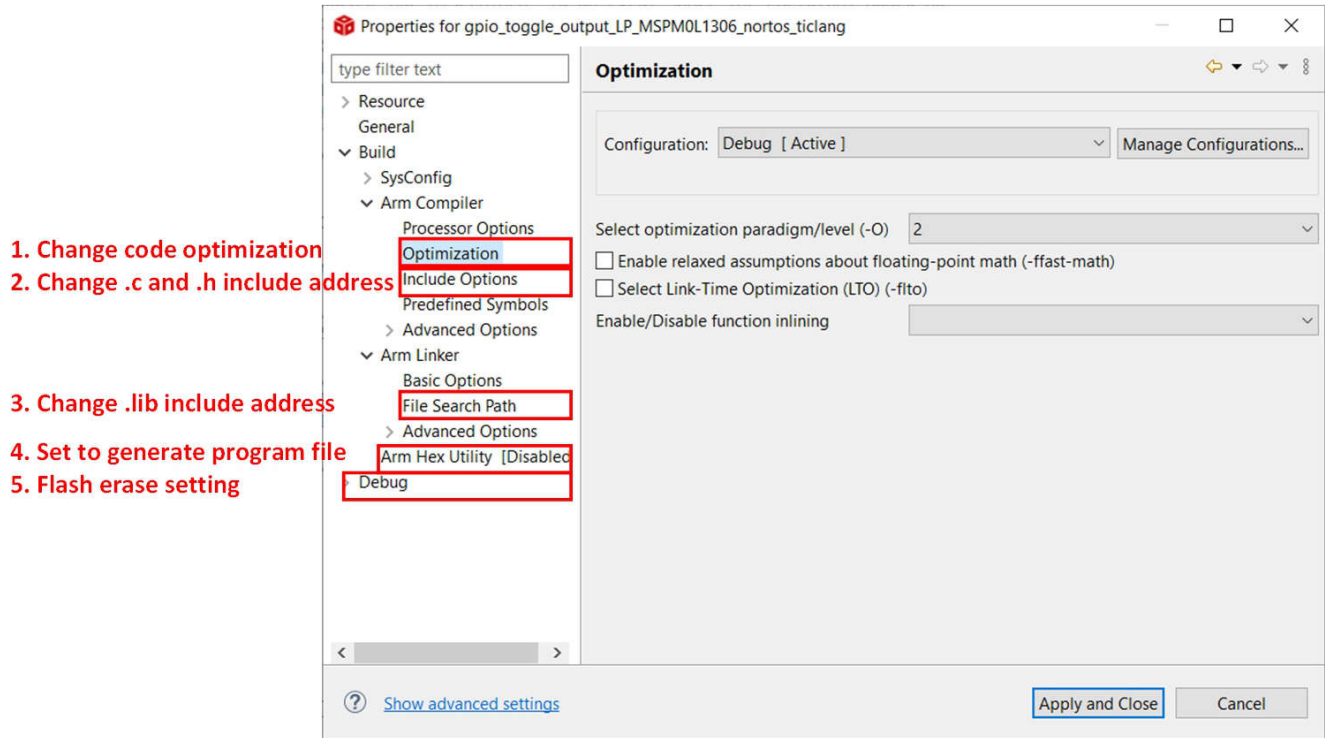

Figure A-9. Common Used Project Settings

b. Debug common used functions.

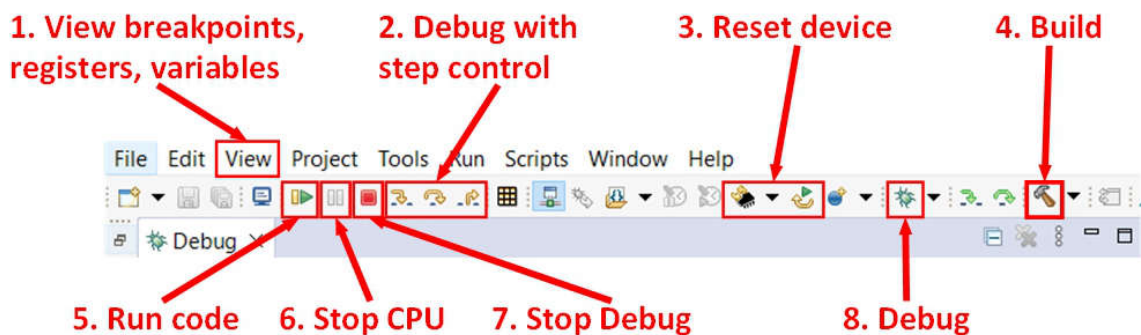

Figure A-10. Common Used Debug Functions

A.2 Steps to Generate the PCB Library

1. Go to the start page of the Ultra Librarian tool under the MSPM0 device page using the steps shown in Figure A-11.

Figure A-11. Ultra Librarian Tool Start Page

2. Select the desired CAD format and pin ordering to obtain the Altium design library file.

Figure A-12. Ultra Librarian Tool Device Selection

3. The Altium Designer library file is used as an example.

Figure A-13. Ultra Librarian Tool CAD Download

4. Run the *Altium Designer* script as shown in Figure A-14.

Figure A-14. Run Altium Designer Script

5. Generate the PCB library and schematic library as shown in [Figure A-15](#).

Figure A-15. Generate Library

6. Select the correct footprint under *PCB Library*.

Figure A-16. Select Footprint

7. Import the PCB library and schematic library.

Figure A-17. Import Library

A.3 MSP-GANG Quick Introduction

This section shows how to use MSP-GANG to the MSPM0 offline program. The section shows how to use MSP-GANG with a GUI to program an MSPM0 device.

1. Finish the pin connection used for software as shown in [Figure A-18](#).

Figure A-18. MSP-GANG Pin Assignment

2. After the hardware setup is finished, follow the programming steps. For Step 2, see [Section 5.1](#) to generate the code file. For Step 4, the enabled target is related to the hardware port used, which is labeled numerically next to the port.

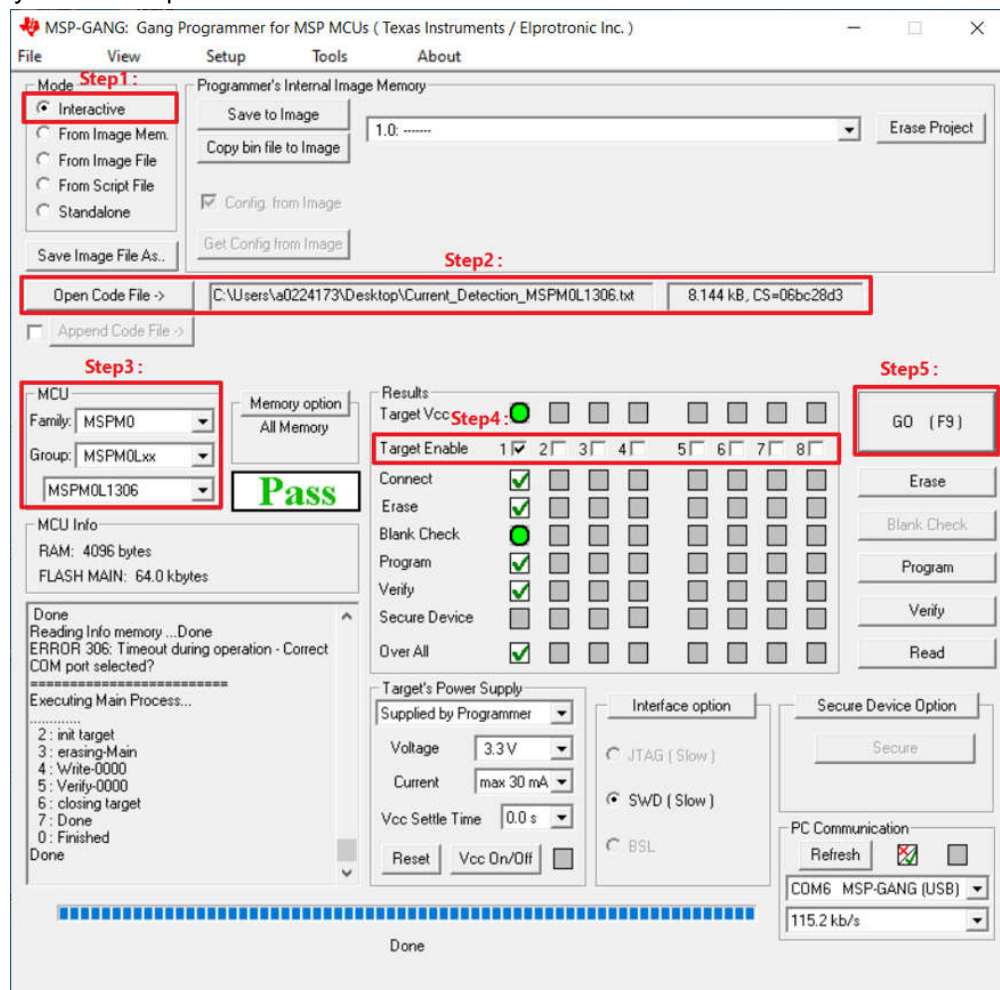

Figure A-19. Download Code Using MSP-GANG With GUI

- To change the code file in the non-main (SWD and BSL configure flash area), enable this function first.

Figure A-20. Enable Non-Main Programming

- Save the code file and settings into MSP-GANG. Assign a project name to this image. Then click *Save to Image* as shown in [Figure A-21](#).

Figure A-21. Generate and Save Image

- Change the mode to standalone or directly close the GUI.

Figure A-22. Change Mode

- If only one image is saved in the MSP-GANG, click Go to do the programming. If more than one image is saved, switch to the correct image first.

Figure A-23. Offline Programming

Revision History

Changes from Revision B (September 2023) to Revision C (July 2024)

Page

• Added Table 3-1	7
• Added Section 3.2	9
• Added Section 3.2.1	9
• Added Section 3.2.2	10
• Added Section 3.3	14
• Added Section 3.3.1	14
• Added Section 3.3.2	15
• Added Section 3.4	20
• Added Section 3.4.1	21
• Added Section 3.4.2	29
• Added Section 3.4.3	35
• Added Section 4.1	45
• Updated Section 5 . Added more reference links to MSPM0.....	48
• Updated Section 5.3 . Added more detailed instructions and pictures.....	52
• Added Section 6	53
