

# CC3100 HTTP Server

---

## Overview

[Return to CC31xx & CC32xx Home Page](#)

This sample application demonstrates the capability of CC3100 device to work as a web-server and allowing the end-users to communicate w/ it using standard web-browsers.

For more information refer to **HTTP Server** section of Programmers Guide <sup>[1]</sup>

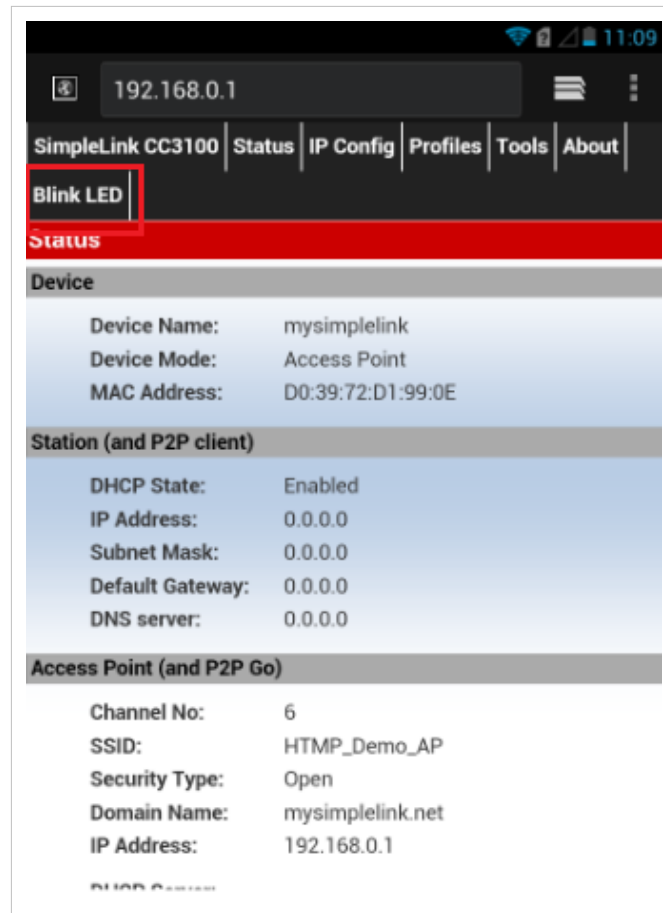

**Note:** This wiki page is only applicable for **CC3100-SDK v1.0.0** and upward releases. For documentation on older SDKs' examples, refer corresponding file in `<cc3100-sdk-installation-location>\cc3100-sdk\docs\examples\`

## Application details

This application configures the CC3100 in AP mode with a pre-defined SSID-NAME and uses the sample HTML pages to toggle on-board LEDs. **GET** and **POST** tokens are used to get the LEDs' status and toggle the LEDs respectively. Clients can connect to CC3100 and request for web-pages using the IP of device from any standard web browser. The HTML pages provided with the sample application needs to be downloaded on serial-flash using CCS\_UniFlash <sup>[2]</sup> utility. The authentication parameters and domain name can be changed using corresponding host-driver APIs.

## Usage

- Flash **main.html** and **blink\_led.html** on serial-flash by following the below steps:
  1. Open the Configuration-file at `<cc3100-sdk-installation>/examples/http_server/uniflash_template/http_server.ucf` in Uniflash
  2. Flash the files on the device. Uniflash User Guide has detailed instructions for flashing
- Configure the terminal program for seeing the logs - CC3100 & CC3200 Terminal Setting has detailed instructions for flashing
- Edit **sl\_common.h** and modify the value for **SSID\_AP\_MODE**, **PASSWORD\_AP\_MODE** and **SEC\_TYPE\_AP\_MODE**.
- Build and launch the project. CC3100 will come-up in AP mode w/ the value set above as its SSID name
- Connect a client w/ CC3100 using its SSID name
- Open a web-browser on the client and enter the IP of CC3100 in the client's address bar
  - Default IP address is 192.168.1.1
  - Alternatively, 'mysimplelink.net' can also be entered for accessing the web page
- Use authentication parameters displayed on the terminal to log in.
- On the page that gets displayed, click on the 'Blink LED'

- Use LED buttons to turn ON/OFF the LEDs on the MCU board.

**Note:** : User needs to reconfigure the device in 'Station-Mode' for executing other sample applications. Refer function `configureSimpleLinkToDefaultState` in this example's `main.c` for configuring the device in 'Station-Mode'.

## Limitations/Known Issues

- Supports HTTP 1.0 only
