

CDCLVD1204 - Unused input pins

We understand that, it is recommended to connect both input pins (INP, INN) to GND through 1kohm resistors.

Our customer already have a designed with the below pin connection.

[Question]

Would there be any problem with the unused input connection below ?

It seems that there would be only +/- 10uA MAX.

Case 1) Connected INPx to VCC, INNx to GND

Case 2) Connected INPx to VAC_REF, INNx to GND
